Acknowledgement

This user's guide is constructed with contributions from distributed GSI developers and users. We would like to acknowledge the time and efforts by these contributors and reviewers, including, but not limit to:

National Centers for Environmental Prediction (NCEP) Environmental Modeling Center (EMC):

John Derber, Russ Treadon, Mike Lueken, Wan-Shu Wu, Andrew Collard, and Ed Safford

National Center for Atmospheric Research (NCAR): Xiang-Yu Huang, Syed Rizvi, Zhiquan Liu, and Arthur Mizzi

National Oceanic and Atmospheric Administration (NOAA) Earth System Research Laboratory (ESRL):

Steve Weygandt, Dezso Devenyi, and Joseph Olson

The GSI community support and code management effort is sponsored by NOAA's Office of Oceanic and Atmospheric Research (OAR). This work is also facilitated by NCAR. NCAR is supported by the National Science Foundation (NSF).

Foreword

This document is the 2018 Gridpoint Statistical Interpolation (GSI) User's Guide, geared particularly for beginners. It describes the fundamentals of using GSI version (v) 3.7 released in November 2018. More advanced applications of GSI as well as details of assimilating specific data types can be found in the Advanced GSI User's Guide.

This User's Guide includes six chapters and three appendices:

Chapter 1 provides a background introduction of GSI.

Chapter 2 contains basic information about how to install and compile GSI - including system requirements, required software, GSI system download, and information about compilers, libraries, and building the code.

Chapter 3 focuses on the input files needed to run GSI and how to configure and run GSI through a sample run script. It also provides an example of a successful GSI run and explanations of often-used namelist variables.

Chapter 4 includes information about diagnostics and tuning of the GSI system through GSI standard output, statistic fit files, and some diagnostic tools.

Chapter 5 illustrates the GSI applications for regional WRF-ARW cases, including the setup of different data types such as conventional, radiance, and GPSRO data, and different analysis functions available in the GSI, such as running a hybrid analysis. GSI applications for global and chemical cases are also illustrated.

Appendix A introduces community tools available for GSI users.

Appendix B describes the content of the GSI namelist section OBS_INPUT.

Appendix C contains a complete list of the GSI namelist with explanations and default values.

For the latest version of the GSI documentation and code, please visit the GSI User's Website:

http://www.dtcenter.org/com-GSI/users/index.php

Please send questions and comments to the GSI help desk:

gsi-help@ucar.edu

This document and the annual GSI releases are made available through a community GSI effort jointly led by the Developmental Testbed Center (DTC) and the National Centers for Environmental Prediction (NCEP) Environmental Modeling Center (EMC), in collaboration with other GSI developers. To help sustain this effort, we request that those who use the

community-released GSI, the GSI helpdesk, the GSI User's Guide, or other DTC GSI services, please refer to this community GSI effort in their work and publications.

To reference this user's guide, please use:

Overview

1.1 GSI History and Background

The Gridpoint Statistical Interpolation (GSI) system is a unified data assimilation (DA) system for both global and regional applications. It was initially developed by the National Centers for Environmental Prediction (NCEP) Environmental Modeling Center (EMC) as a next generation analysis system based on the then operational Spectral Statistical Interpolation (SSI) analysis system ([4]; [1]; [2]). Instead of being constructed in spectral space like the SSI, the GSI is constructed in physical space and is designed to be a flexible, state-of-art system that is efficient on available parallel computing platforms. Starting with a three-dimensional variational (3DVar) data assimilation technique, the current GSI can be run as a data assimilation system of 2DVar (for surface data analysis), 3DVar, 3D ensemble-variational (3D EnVar), 4D EnVar, 3D/4D hybrid EnVar, or 4DVar (if coupled with an adjoint model from a GSI supported forecast system).

After initial development, the GSI analysis system became operational as the core of the North American Data Assimilation System (NDAS) for the North American Mesoscale (NAM) system in June 2006 and the Global Data Assimilation System (GDAS) for the Global Forecast System (GFS) in May 2007 at National Oceanic and Atmospheric Administration (NOAA). Since then, the GSI system has been adopted in various operational systems, including the National Aeronautics and Space Administration (NASA) Goddard Earth Observing System Model (GEOS), the United States Air Force (USAF) mesoscale data assimilation system, the NOAA Real-Time Mesoscale Analysis (RTMA) system, the Hurricane Weather Research and Forecasting (WRF) model (HWRF), and the Rapid Refresh (RAP) and High Resolution Rapid Refresh (HRRR) systems. The current version of GSI is also used as the data assimilation system in coming Finite-Volume Cubed-Sphere Dynamical Core (FV3) GFS system (Fv3GFS).

1.2 GSI Becomes Community Code

In 2007, the Developmental Testbed Center (DTC) began collaborating with major GSI development groups to transform the operational GSI system into a community system and support distributed development ([3]). The DTC complements the development groups in providing GSI documentation, porting GSI to multiple platforms, and testing GSI in an independent and objective environment, while maintaining equivalent functionality to what used in the operational centers. Since 2009, due to the NOAA security constraints, the DTC has been maintaining a community GSI code repository, which mirrors the EMC operational GSI code repository and facilitates community users to develop GSI. In 2017, the DTC and EMC worked together to build a unified GSI code repository for both operational and community developers and users. The unified repository facilitates direct communication among developers and helps accelerate transitions between research and operations. Based on this unified repository, the DTC releases this version of the GSI code with updated documentation.

The first community version of the GSI system was released in 2009. This user's guide describes the release of GSI (v3.7) in November 2018. The DTC provides user support through the GSI Helpdesk (gsi-help@ucar.edu), tutorials, and workshops. More information about the GSI community services can be found at the DTC GSI webpage (https://dtcenter.org/com-GSI/users).

1.2.1 GSI Code Management and Review Committee

The GSI code development and maintenance are managed by the Data Assimilation Review Committee (DARC). It was originally formed as the GSI Review Committee in 2010, with the goal of incorporating all major GSI development teams in the United States within a unified community framework. In 2014, EMC and DTC decided to merge their GSI code repository with the code repository of the NOAA ensemble Kalman filter (EnKF) data assimilation system. This merge enabled coordinated development of both systems and joint community support. Following the repository merging, the GSI Review Committee was transitioned to DARC, incorporating new members representing EnKF development and applications. Currently, DARC contains members from NCEP/EMC, NASA's Goddard Global Modeling and Assimilation Office (GMAO), NOAA's Earth System Research Laboratory (ESRL), the Joint Center for Satellite Data Assimilation (JCSDA), the National Center for Atmospheric Research (NCAR) Mesoscale & Microscale Meteorology Laboratory (MMM), the National Environmental Satellite, Data, and Information Service (NESDIS), USAF, the University of Maryland, and the DTC. The DTC also releases the EnKF system annually (along with GSI). Please refer to the community EnKF user's webpage (https://dtcenter.org/EnKF/ users/) for more information.

DARC primarily steers distributed GSI/EnKF development, community code management, and support. The responsibilities of the committee are divided into two major aspects: coordination and code review. The purpose and guiding principles of the review committee are as follows:

- Coordination and advisory
 - Propose and shepherd new development
 - Coordinate on-going and new development
 - Establish and manage a code review and transition process
 - Community support recommendation
- Code review
 - Establish and manage a unified coding standard followed by all GSI/EnKF developers
 - Review proposed modifications to the unified code repository
 - Make decisions on whether code change proposals are accepted or denied for inclusion in the repository
 - Manage the repository
 - Oversee the timely testing and inclusion of code into the repository

1.2.2 Community Code Contributions

GSI is a community data assimilation system, open to contributions from scientists and software engineers from both the operational and research communities. DARC oversees the code transition from prospective contributors. This committee reviews proposals for code commits to the GSI repository and ensures that coding standards and tests are being fulfilled. Once the committee approves, the contributed code will be committed to the GSI code repository and available for operational implementation and public release.

To facilitate this process, the DTC is providing code transition assistance to the general research community. Prospective code contributors should contact the DTC GSI helpdesk (gsi-help@ucar.edu) as early as possible. It is contributor's responsibility to ensure the proposed code change is correct, meeting GSI coding standards, and well documented. The DTC will help the contributor run regression tests and merge the code with the top of the repository. Prospective contributors can also apply to the DTC visitor program for their GSI research and code transition. The visitor program is open to applications year-round. Please check the visitor program webpage (https://dtcenter.org/visitor-program) for the latest announcement of opportunity and application procedures.

1.3 About This GSI Release

As a critical part of the GSI user support, this document is provided to assist users in applying GSI to data assimilation and analysis studies. It was composed by the DTC and reviewed by the DARC members. Please note that the major focuses of the DTC are currently on testing and evaluation of GSI for regional numerical weather prediction (NWP). GSI for global and chemical applications are briefly discussed in the document. The document is based on GSI v3.7 release. Active users can contact the DTC (gsi-help@ucar.edu) for developmental versions of GSI and access to the GSI code repository.

1.3.1 What Is New in This Release Version

The following lists some of the new functions and changes included in the v3.7 release of the GSI versus the v3.6 release:

Observational aspects:

- Further code generalization on all-sky radiance assimilation
- Added the capability of assimilating satellite hydrometeor retrievals (integrated liquidwater content (LWC) and integrated solid-water content (SWC)) into GSI
- Added assimilation of KOMPSAT5 GPSRO data
- Modifications and improvements for CrIS and CrIS-FSR analysis
- Updated CRTM library and coefficients to version 2.3

Code optimization and refactoring:

- Added wrf interface as a library (wrflib). No need to compile WRF with GSI and EnKF
- Added code to read in multiple-time level ARW ensemble forecast to get 4D perturbations

Application specific updates:

- Application for FV3
 - Added FV3GFS interface
 - Added regional GSI interface with single FV3 tile
 - Added new scripts and fix files for using global and regional FV3 applications
- RTMA
 - Updated mesonet uselist
 - Added assimilation of mesonet visibility data

Other enhancements and updates:

- Removed GOTO statements from the code.
- Added capability to read GFS ensemble member nemsio files in parallel simultaneously
- Removed srw data type option
- Clean up the output and add a "verbose" namelist flag.
- Updated surface pressure observation error
- Added Safeguard to filter out bad data in the radiance bias correction.
- Utility updates such as radar data plotting.
- · Bug fixes

Besides the above-mentioned changes, this version release code have a unified cmake-based build system. This cmake build system has been tested on mupltiple platform by DTC and EMC and released as the only building utility for this release version of GSI.

1.3.2 Observations Used by This Version

GSI is used by various applications on multiple scales. The types of observations GSI can assimilate vary from conventional to aerosol observations. Users should use observations with caution to fit their specific applications. The GSI v3.7 can assimilate, but is not limited to, the following types of observations:

Conventional observations (including satellite retrievals):

- Radiosondes
- Pilot ballon (PIBAL) winds
- Synthetic tropical cyclone winds
- Wind profilers: USA, Jan Meteorological Agency (JMA)
- Conventional aircraft reports
- Aircraft to Satellite Data Relay (ASDAR) aircraft reports
- Meteorological Data Collection and Reporting System (MDCRS) aircraft reports
- Dropsondes
- Moderate Resolution Imaging Spectroradiometer (MODIS) IR and water vapor winds
- Geostationary Meteorological Satellite (GMS), JMA, and Meteosat cloud drift IR and visible winds
- European Organization for the Exploitation of Meteorological Satellites (EUMETSAT) and GOES water vapor cloud top winds
- GEOS hourly IR and cloud top wind
- Surface land observations
- Surface ship and buoy observations
- Special Sensor Microwave Imager (SSMI) wind speeds
- Quick Scatterometer (QuikSCAT), the Advanced Scatterometer (ASCAT) and Oceansat-2 Scatterometer (OSCAT) wind speed and direction
- RapidScat observations
- SSM/I and Tropical Rainfall Measuring Mission (TRMM) Microwave Imager (TMI) precipitation estimates
- Velocity-Azimuth Display (VAD) Next Generation Weather Radar ((NEXRAD) winds
- Global Positioning System (GPS) precipitable water estimates
- Sea surface temperatures (SSTs)
- Doppler wind Lidar
- Aviation routine weather report (METAR) cloud coverage
- Flight level and Stepped Frequency Microwave Radiometer (SFMR) High Density Observation (HDOB) from reconnaissance aircraft
- Tall tower wind

Satellite radiance/brightness temperature observations (instrument/satellite ID):

- SBUV: NOAA-17, NOAA-18, NOAA-19
- High Resolution Infrared Radiation Sounder (HIRS): Meteorological Operational-A (MetOp-A), MetOp-B, NOAA-17, NOAA-19
- GOES imager: GOES-11, GOES-12
- Atmospheric IR Sounder (AIRS): aqua

1. Overview

- AMSU-A: MetOp-A, MetOp-B, NOAA-15, NOAA-18, NOAA-19, aqua
- AMSU-B: MetOp-B, NOAA-17
- Microwave Humidity Sounder (MHS): MetOp-A, MetOp-B, NOAA-18, NOAA-19
- SSMI: *DMSP F14*, *F15*, *F19*
- SSMI/S: *DMSP F16*
- Advanced Microwave Scanning Radiometer for Earth Observing System (AMSR-E): aqua
- GOES Sounder (SNDR): GOES-11, GOES-12, GOES-13
- Infrared Atmospheric Sounding Interferometer (IASI): MetOp-A, MetOp-B
- Global Ozone Monitoring Experiment (GOME): MetOp-A, MetOp-B
- Ozone Monitoring Instrument (OMI): aura
- Spinning Enhanced Visible and Infrared Imager (SEVIRI): Meteosat-8, Meteosat-9, Meteosat-10
- Advanced Technology Microwave Sounder (ATMS): Suomi NPP
- Cross-track Infrared Sounder (CrIS): Suomi NPP
- GCOM-W1 AMSR2
- GPM GMI
- Megha-Tropiques SAPHIR
- Himawari AHI

Others:

- GPS Radio occultation (RO) refractivity and bending angle profiles
- Solar Backscatter Ultraviolet (SBUV) ozone profiles, Microwave Limb Sounder (MLS) (including NRT) ozone, and Ozone Monitoring Instrument (OMI) total ozone
- Doppler radar radial velocities
- Radar reflectivity Mosaic
- Tail Doppler Radar (TDR) radial velocity and super-observation
- Tropical Cyclone Vitals Database (TCVital)
- Particulate matter (PM) of 10-um diameter, 2.5-um diameter or less
- MODIS AOD (when using GSI-chem package)
- Significant wave height observations from JASON-2, JASON-3, SARAL/ALTIKA and CRYOSAT-2

Please note that some of these above mentioned data are not yet fully tested and/or implemented for operations. Therefore, the current GSI code might not have an optimal setup for these data.

2

Software Installation

2.1 Introduction

The DTC GSI is a community distribution of NOAA's operational GSI. The community GSI expands the portability of the operational code by adding a flexible build system which provides support for many common platforms and compilers. GSI v3.7 builds and runs on most standard Linux platforms using Intel, PGI, or Gnu compilers.

This chapter describes how to build and install the DTC community GSI software on your local Linux computing resources.

The GSI build process consists of three general steps:

- Obtaining the source code for GSI.
- Setting the appropriate environment variables for the GSI build.
- Configuring and compiling the GSI source code using CMake.

This chapter is organized as follows: Section 2.2 describes how to obtain the source code. Section 2.3 covers the directory structure and supplemental NCEP libraries included with the distribution. Section 2.4 starts with an brief overview of CMake and continues with an example of the build process in section 2.4.1. Section 2.4.2 describes all of the current optional settings for the build. Sections 2.5 and 2.5.1 cover the system requirements (tools, libraries, and environment variable settings) and currently supported platforms in detail. Section 2.6 discusses what to do if you have problems with the build and where to get help.

Advanced topics, such as customizing the build, porting to new platforms, and debugging

can be found in the GSI Advanced User's Guide.

2.2 Obtaining and Setting Up the Source Code

The community GSI resources, including source code, build system, utilities, practice data, and documentation, are available from the DTC community GSI users website, located at

```
http://www.dtcenter.org/com-GSI/users/index.php
```

The source code is available by first selecting the <u>Download</u> tab on the vertical menu located on the left column of the page, and then selecting the <u>GSI/EnKF System</u> submenu. New users must first register before downloading the source code. Returning users only need to enter their registration email address to log in. After accessing the download page, select the link to the comGSIv3.7_EnKFv1.3.tar tarball to download the most recent version of the source code (November 2018). Selecting the newest release of the community GSI is critical for having the most recent capabilities, versions of supplemental libraries, and bug fixes. Full support is only offered for the latest code releases.

To analyze satellite radiance observations, GSI requires the use of CRTM coefficients. It is crucial to use **only** the version of CRTM coefficients provided on the GSI website. Due to their large size, these are available as a separate tarfile. They can be downloaded by selecting the link to the tarball for the CRTM 2.3.0 Big Endian coefficients from the web page. For all compilers, use the big endian byte order coefficients found in the first CRTM link.

The download page also contains links to the fixed files necessary for running global GSI:

• Global fix files to run Global GSI

The community GSI version 3.7 comes in a tar file named comGSIv3.7_EnKFv1.3.tar. The tar file may be unpacked by using the UNIX commands:

```
gunzip comGSIv3.7_EnKFv1.3.tar.gz
tar -xvf comGSIv3.7_EnKFv1.3.tar
```

This creates the top level GSI directory comGSIv3.7_EnKFv1.3/. After downloading the source code, and prior to building, the user should check the known issues link on the download page of the DTC website to determine if any bug fixes or platform specific customizations are needed.

2.3 Directory Structure, Source Code and Supplemental Libraries

The GSI system includes the GSI source code, the build system, supplemental libraries, fixed files, and run scripts. Again, with V3.7 of GSI the directory structure has been slightly

changed to accommodate the new CMake build system. The following table lists the system components found inside the root GSI directory.

Table 2.1: Description of top level directories

Directory Name	Content		
cmake/	CMake build rules and configure files.		
fix/	Fixed input files required by a GSI analysis, such as		
	background error covariances, observation error tables;		
	Excluding the CRTM coefficients		
libsrc/	Supplemental library source code, required for the CMake build		
README.comgsi	An overview on how to build/run GSI/EnKF and get helps		
README.GSI_Docker	An overview on how to run GSI/EnKF in a docker container		
ush/	Sample run scripts and namelists		
src/	GSI source code and makefiles		
src/enkf	EnKF source code and makefiles		
util/	Tools for GSI diagnostics		

For convenience, supplemental NCEP libraries for building GSI are included in the libsrc/directory. These libraries will be built prior to compiling GSI. These supplemental libraries are listed in the table below.

Table 2.2: List of NCEP libraries used by GSI

Directory Name	Content
bacio/	NCEP BACIO library
bufr/	NCEP BUFR library
crtm/	JCSDA community radiative transfer model
GSD/	GSD Cloud analysis library
ncdiag/	Misc NetCDF libraries
nemsio/	NEMS I/O library
sfcio/	NCEP GFS surface file i/o module
sigio/	NCEP GFS atmospheric file i/o module
sp/	NCEP spectral - grid transforms
w3emc/	NCEP/EMC W3 library (date/time manipulation, GRIB)
w3nco/	NCEP/NCO W3 library (date/time manipulation, GRIB)
wrflib	WRF IO libraries

2.4 CMake Build System

A new unified build system based on CMake has been added to the GSI code. While the new build system is a significant departure from the previous DTC build system, CMake is a very powerful cross-platform open-source build system that has many capabilities to make building GSI easier.

The CMake build infrastructure consists of a top level directory with the name cmake/ and configuration files in each directory named (CMakeLists.txt). CMake relies on a two step command line process, similar to the old UNIX "configure" and "compile." Command line arguments are used to specify paths and compilers. By default CMake is configured to build the source code "out-of-place," meaning that it does not populate the GSI directory with the build. The location for the build must be specified by the user.

Once a compiler has been chosen, CMake generates local makefiles by invoking the cmake command with the proper arguments. One of those arguments selects that a local build of the NCEP libraries needed by GSI will be conducted prior to the source code being built. The final step is to invoke a parallel build (make) of the code.

A significant advantage with using CMake to build the code, is that CMake automatically generates code dependencies each time a build is invoked, allowing the use of a parallel make as the final step of the build. This greatly reduces the time it take to complete the build. Because of the parallel compiling, the time to complete the CMake build is typically a quarter of the time needed for the serial DTC "configure" and "compile" to complete.

Once the build is complete, the two executables a gsi.x and enkf_wrf.x are placed in the bin directory of the build directory. Note that the name of the executables and their location differs from the traditional DTC build.

Summary of CMake build steps:

- 1. Set up the build environment
 - · Select a specific compiler by loading modules or setting paths as needed
 - Set the environment path for the NetCDF library (The HDF5 library is also needed if your NetCDF version is 4+).
 - Set the LaPack/MKL mathematics libraries as needed.
- 2. Create a directory for your build and change into it.
- 3. Run the cmake command with the appropriate arguments.
- 4. Run make
- 5. The completed executables gsi.x and enkf_wrf.x will be located in the build directory within the bin directory.

2.4.1 Example build using the Intel Fortran Compiler

This section details how to build GSI on the NCAR supercomputer Cheyenne using the Intel V18.0.1 fortran compiler, the 2018 MKL libraries, NetCDF v4.6.1, and the 2018 Intel MPI libraries.

Set up your build environment

```
module purge
module load cmake/3.9.1
module load intel/18.0.1 ncarenv/1.2 ncarcompilers/0.4.1 mkl/2018.0.1
module load netcdf/4.6.1
module load impi/2018.1.163
```

• Next, create a build directory and move into it.

mkdir ./build cd build

• From within the build directory, invoke the cmake command

```
cmake path_to_the_comGSI_directory
```

The makefiles customized to your platform and the environment you have set are now created.

• Run make (parallel compile) on eight cores

make -j8

Because CMake has already figured out the dependencies, the make can run in parallel.

Lets look at relevant arguments you may use for cmake when building GSI. The first is -DBUILD_CORELIBS=ON. This argument directs CMake to look in the libsrc/ directory to build the NCEP libraries needed for GSI. Default is ON, so you don't need to use this argument by default.

The argument CMAKE_C_COMPILER specifies the C compiler to use with the build. For the Intel compiler, use icc. The argument CMAKE_CXX_COMPILER specifies the C++ compiler to use with the build. For the Intel compiler, use icpc. The argument CMAKE_Fortran_COMPILER specifies the Fortran compiler to use with the build. Because this is an parallel MPI code, on Cheyenne use mpif90 instead of ifort. Typically, the only time one would explicitly specify the compilers on the command line is when you wish to override a default choice set in your dot files or if you were to create a batch script to conduct the build.

To run the cmake command with a compiler other than Intel only requires replacing the values for CMAKE_C_COMPILER, CMAKE_CXX_COMPILER, and CMAKE_Fortran_COMPILER that correspond to the new compiler. Table 2.3 lists these values.

Compiler	С	C++	FC
Intel	icc	icpc	mpif90
PGI	pgcc	pgcc++	mpif90
GNU	gcc	g++	mpif90

Table 2.3: The compiler specific values for the cmake compiler argument

2.4.2 Default Options

The CMake build has a number of options to when building. These are enacted by adding the option with the prefix -D to the command line call to cmake. For instance, in the example above, the BUILD_CORELIBS option is enacted by adding -DBUILD_CORELIBS=ON to the cmake call. The currently available command line build options are:

- BUILD_ENKF: builds the enkf executable (default is ON)
- BUILD_CORELIBS: Attempts to build the core libraries froim source
- USE_WRF: Builds GSI with WRF dependencies (default is ON)
- BUILD_GFS: Builds ENKF using GFS (default is ON)

- BUILD_WRF: Builds ENKF using WRF (default is OFF)
- BUILD_NMMB: Builds ENKF using NMMB (default is OFF)

Note that by default GSI is built with the regional WRF IO bindings, and EnKF is built with GFS. See the readme file *README.cmake* in the top directory for a current list of options; or look in the CMakeLists.txt in the top directory and search for options.

2.5 Software Requirements and Compiler Specific Notes

The source code for GSI is written in FORTRAN, FORTRAN 90, and C. In addition, the parallel executables require some flavor of MPI and OpenMP for the distributed memory parallelism. The I/O relies on the NetCDF I/O libraries. And CMake is needed to build the code.

The basic requirements for building and running the GSI system are the following:

- CMake V2.8+
- A FORTRAN compiler that supports the 2003 or newer standard
- C compiler
- MPI v1.2+
- OpenMP
- NetCDF V4.2+ and HDF5
- LAPACK and BLAS mathematics libraries, or equivalent

In addition, GSI and EnKF require linear algebra libraries such as LAPACK and BLAS. The Intel compiler usually comes with a vendor provided mathematics library known as the *Mathematics Kernel Libraries* or MKL for short. While *most* installations of the Intel compiler come with the MKL libraries installed not all do. In addition, if it is not installed correctly, the ifort compiler does not automatically load the library. It is therefore necessary to set the LAPACK_PATH variable to the location of the MKL libraries when using the Intel compiler. You may need to ask your system administrator for the correct path to these libraries.

IBM systems typically come installed with the LAPACK equivalent ESSL library that links automatically. Likewise, the PGI compiler often comes with a vendor provided version of LAPACK that links automatically with the compiler. The Gnu compiler is the only one that does not come with any installed version of the LAPACK and BLAS libraries.

Because all but the last of these tools and libraries are typically the purview of system administrators to install and maintain, they are lumped together here as part of the basic system requirements.

2.5.1 Compilers Tested for Release

Version 3.7 of the DTC community GSI system extensively tested with a variety of compilers and versions of those compilers, on standard Linux platforms. To summarize, Intel com-

piler versions 16-18 should build and run without issue. Early version 15 has some known issues, but 15.1, 15.3, and 15.6 should work. For the Portland Group compiler, versions 16-18 should work without issue, and Gnu version 6.3, 7.1, and 7.3 are known to work. Version 18 of Gnu has issues and is not currently supported. See release notes ((https://dtcenter.org/com-GSI/users/support/release_notes/index_GSIv3.7.php) for the complete list compilers and versions tested.

Unforeseen build issues may occur when using older compiler and library versions. As always, the best results will be achieved by using the most recent compiler versions.

2.6 Getting Help and Reporting Problems

Should a user experience any difficulty building GSI on their system, please first confirm that all the required software is properly installed. Should all these check out, feel free to contact the community GSI Help Desk for assistance at

gsi-help@ucar.edu

At a minimum, when reporting code building problems to the helpdesk, please include a copy of the build log with your e-mail.

3

Running GSI

This chapter discusses the issues of running GSI. It starts with introductions to the input data required to run GSI, then proceeds with a detailed explanation of an example GSI run script and introductions to files produced by a successful GSI run. It concludes with some frequently used options from the GSI namelist.

3.1 Input Data Required to Run GSI

In most cases, three types of input data (background, observations, and fixed files) must be available before running GSI. In some special idealized cases, such as a pseudo single observation test, GSI can be run without any observations. If running GSI with the 3D EnVar hybrid option, global or regional ensemble forecasts are also needed.

3.1.1 Background or First Guess Field

As with other data analysis systems, the background or first guess fields may come from a model forecast conducted separately or from a previous data assimilation cycle. The following is a list of the types of background files that can be used by this release version of GSI:

- a) WRF-NMM input fields in binary format
- b) WRF-NMM input fields in NetCDF format
- c) WRF-ARW input fields in binary format
- d) WRF-ARW input fields in NetCDF format

- e) GFS input fields in binary format or through NEMS I/O
- f) NEMS-NMMB input fields
- g) RTMA input files (2-dimensional binary format)
- h) WRF-Chem GOCART input fields with NetCDF format
- i) CMAQ binary file

The Weather Research and Forecasting (WRF) community modeling system includes two dynamical cores: the Advanced Research WRF (ARW) and the Nonhydrostatic Mesoscale Model (NMM). The GFS (Global Forecast System), NEMS (National Environmental Modeling System)-NMMB (Nonhydrostatic Mesoscale Model B-Grid), and RTMA (Real-Time Mesoscale Analysis) are operational systems at the National Center for Environmental Prediction (NCEP). The DTC mainly supports GSI for regional WRF applications. Therefore, most of the multiple platform tests were conducted using WRF netcdf background files (d). The DTC also supports the GSI in global and chemical applications with limited resources. The following backgrounds have been tested for this release:

- 1. ARW NetCDF (d) were tested with multiple cases
- 2. GFS (e) was tested with multiple NCEP cases
- 3. WRF-Chem NetCDF (h) was tested with a single case
- 4. NEMS-NMMB(f) was tested with a single case

3.1.2 Observations

GSI can analyze many types of observational data, including conventional data, satellite radiance observations, GPS Radio Occultations, and radar data, among others. The default observation file names are given in the released GSI namelist, with corresponding observations included in each file. Sample BUFR files available for download from the NCEP website listed in table 3.1.

The observations are complex and many observations need format converting and quality control before being used by GSI. GSI ingests observations saved in BUFR format (with NCEP specified features). The NCEP processed PrepBUFR and BUFR files can be used directly. If users need to introduce their own data into GSI, please check the following website for the User's Guide and examples of BUFR/PreBUFR processing:

http://www.dtcenter.org/com-GSI/BUFR/index.php

DTC supports BUFR/PrepBUFR data processing and quality control as part of the GSI community tasks.

GSI can analyze all of the data types in table 3.1, but each GSI run (for both operation and case study purposes) only uses a subset of the data. Some data may be outdated and not available, some are in monitoring mode, and some may have quality issues during certain periods. Users are encouraged to check data quality prior to running an analysis. The following NCEP links provide resources that include data quality history:

http://www.emc.ncep.noaa.gov/mmb/data_processing/Non-satellite_Historical_Documentation.htm

Because the current regional models do not have ozone as a prognostic variable, ozone data are not assimilated on the regional scale.

GSI can be run without any observations to see how the moisture constraint modifies the first guess (background) field. GSI can also be run in a pseudo single observation mode, which does not require any BUFR observation files. In this mode, users should specify observation information in the namelist section SINGLEOB_TEST (see Section 4.2 for details). As more data files are used, additional information will be added through the GSI analysis.

3.1.3 Fixed Files (Statistics and Control Files)

A GSI analysis also needs to read specific information from statistic files, configuration files, bias correction files, and CRTM coefficient files. We refer to these files as fixed files and they are located in a directory called fix/ in the release package, except for CRTM coefficients.

Table 3.2 lists fixed files required for a GSI run, the content of the files, and corresponding example files from the regional and global applications:

Because most of those fixed files have hardwired names inside the GSI, a GSI run script needs to copy or link those files (right column in table 3.2) from the ./fix directory to the GSI run directory with the file name required in GSI (left column in table 3.2). For example, if GSI runs with an ARW background, the following line should be in the run script:

```
cp ${path of the fix directory}/anavinfo_arw_netcdf anavinfo
```

Note that in this release, there is a strict rule that the numbers of vertical levels in the file anavinfo must match the background file (for example, wrfinput_d01) for the 3-dimensional variables. Otherwise GSI will fail. To identify the correct numbers of vertical levels, users can dump out (use ncdump -h) the dimensions from the NetCDF background file and find the number for bottom_top and bottom_top_stag. For example, if the dimensions for the background file is:

```
bottom_top = 50 ;
bottom_top_stag = 51 ;
```

Then the corresponding analyinfo file should have 51 levels for prse (3-dimensional pressure field) and 50 levels for other three-dimensional variables such as u, v, tv, q, oz, cw, etc. For details, users can dump out the global attributes of the background file and find the number of vertical levels for each variable. The following shows part of the analyinfo file for the above background:

Table 3.1: GSI observation file names, content, and examples

GSI Name	Content	Example file names
prepbufr	Conventional observations, including ps, t, q, pw, uv, spd, dw, sst	gdas1.t12z.prepbufr.nr
satwndbufr	satellite winds observations	gdas1.t12z.satwnd.tm00.bufr_d
amsuabufr	AMSU-A lb radiance (brightness temperatures) from satellites NOAA-15, 16, 17,18, 19 and METOP-A/B	gdas1.t12z.1bamua.tm00.bufr_d
amsubbufr	AMSU-B 1b radiance (brightness temperatures) from satellites NOAA-15, 16,17	gdas1.t12z.1bamub.tm00.bufr_d
radarbufr	Radar radial velocity Level 2.5 data	ndas.t12z.radwnd.tm12.bufr_d
gpsrobufr	GPS radio occultation and bending angle observation	gdas1.t12z.gpsro.tm00.bufr_d
ssmirrbufr	Precipitation rate observations from SSM/I	gdas1.t12z.spssmi.tm00.bufr_d
tmirrbufr	Precipitation rate observations from TMI	gdas1.t12z.sptrmm.tm00.bufr_d
sbuvbufr	SBUV/2 ozone observations from satellite NOAA-16, 17, 18, 19	gdas1.t12z.osbuv8.tm00.bufr_d
hirs2bufr	HIRS2 lb radiance from satellite NOAA-14	gdas1.t12z.1bhrs2.tm00.bufr_d
hirs3bufr	HIRS3 lb radiance observations from satellite NOAA-16, 17	gdas1.t12z.1bhrs3.tm00.bufr_d
hirs4bufr	HIRS4 lb radiance observation from satellite NOAA-18, 19 and METOP-A/B	gdas1.t12z.1bhrs4.tm00.bufr_d
msubufr	MSU observation from satellite NOAA 14	gdas1.t12z.1bmsu.tm00.bufr_d
airsbufr	AMSU-A and AIRS radiances from satellite AQUA	gdas1.t12z.airsev.tm00.bufr_d
mhsbufr	Microwave Humidity Sounder observation from NOAA-18, 19 and METOP-A/B	gdas1.t12z.1bmhs.tm00.bufr_d
ssmitbufr	SSMI observation from satellite fl3, fl4, fl5	gdas1.t12z.ssmit.tm00.bufr_d
amsrebufr	AMSR-E radiance from satellite AQUA	gdas1.t12z.amsre.tm00.bufr_d
ssmisbufr	SSMIS radiances from satellite f16	gdas1.t12z.ssmis.tm00.bufr_d
gsndlbufr	GOES sounder radiance (sndrd1, sndrd2, sndrd3 sndrd4) from GOES-11, 12, 13, 14, 15.	gdas1.t12z.goesfv.tm00.bufr_d
l2rwbufr	NEXRAD Level 2 radial velocity	ndas.t12z.nexrad.tm12.bufr_d
gsndrbufr	GOES sounder radiance from GOES-11, 12	gdas1.t12z.goesnd.tm00.bufr_d
gimgrbufr	GOES imager radiance from GOE-11, 12	-
omibufr	Ozone Monitoring Instrument (OMI) observa- tion NASA Aura	gdas1.t12z.omi.tm00.bufr_d
iasibufr	Infrared Atmospheric Sounding Interfero-meter sounder observations from METOP-A/B	gdas1.t12z.mtiasi.tm00.bufr_d
gomebufr	The Global Ozone Monitoring Experiment (GOME) ozone observation from METOP-A/B	gdas1.t12z.gome.tm00.bufr_d
mlsbufr	Aura MLS stratospheric ozone data from Aura	gdas1.t12z.mlsbufr.tm00.bufr_d
tcvitl	Synthetic Tropic Cyclone-MSLP observation	gdas1.t12z.syndata.tcvitals.tm00
seviribufr	SEVIRI radiance from MET-08,09,10	gdas1.t12z. sevcsr.tm00.bufr_d
atmsbufr	ATMS radiance from Suomi NPP	gdas1.t12z.atms.tm00.bufr_d
crisbufr	CRIS radiance from Suomi NPP	gdas1.t12z.cris.tm00.bufr_d
modisbufr	MODIS aerosol total column AOD observations from AQUA and TERRA

pcpinfo precipitation rate observation in-		global_pcpinfo.txt	
	formation file		
ozinfo	ozone observation information file	global_ozinfo.txt	
	Bias correction and	Rejection list	
satbias_angle	satellite scan angle dependent bias	global_satangbias.txt	
	correction file		
	satellite mass bias correction coef-	sample.satbias	
satbias_in	ficient file		
	combined satellite angle depen-	gdas1.t00z.abias.new	
	dent and mass bias correction co-		
	efficient file		
t_rejectlist,	Rejetion list for T, wind, et al. in	new_rtma_t_rejectlist new_rtma_w_rejectlist	
w_rejectlist,	RTMA		

Each operational system, such as GFS, NAM, RAP, and RTMA, has their own set of fixed files. For your specific GSI runs, you need to get the correct set of fixed files. Fixed files for regional applications are included in this GSI/EnKF release and put under the <code>fix/</code> directory. Fixed files for global applications are not included in this release in order to save space. Please download comGSIv3.7_EnKFv1.3_fix_global.tar.gz if you need to run global cases. Note that little endian background error covariance files are no longer supported.

Each release version of the GSI calls a certain version of the CRTM library and needs corresponding CRTM coefficients to do radiance data assimilation. This version of GSI uses CRTM 2.3.0. The coefficient files are listed in table 3.3.

3. Running GSI

Table 3.3: List of radiance coefficients used by CRTM

File name used in GSI	Content	Example files
Nalli.IRwater.EmisCoeff.bin	IR surface emissivity	Nalli.IRwater.EmisCoeff.bin

	cients	

3.2 GSI Run Script

In this release version, three sample run scripts are available for different GSI applications:

- ush/comgsi_run_regional.ksh for regional GSI
- ush/comgsi_run_global.ksh for global GSI (GFS)
- ush/comgsi_run_chem.ksh for chemical analysis

These scripts will be called to generate GSI namelists:

- ush/comgsi_namelist.sh for regional GSI
- ush/comgsi_namelist_gfs.sh for global GSI (GFS)
- ush/comgsi_namelist_chem.sh for GSI chemical analysis

We will introduce the regional run scripts (comgsi_run_regional.ksh) in detail in the following sections and introduce the global run script when we discuss the GSI global application in Section 6.1.

Note there is also a run script for regional EnKF (comenkf_run_regional.ksh), a run script for global EnKF (comenkf_run_global.ksh) and the EnKF namelist script (comenkf_namelist.sh) in the same directory, which will be introduced in the EnKF User's Guide.

3.2.1 Steps in the GSI Run Script

The GSI run script creates a run time environment necessary to run the GSI executable. A typical GSI run script includes the following steps:

- 1. Request computer resources to run GSI.
- 2. Set environmental variables for the machine architecture.
- 3. Set experimental variables (such as experiment name, analysis time, background, and observation).
- 4. Set the script that generates the GSI namelist.
- 5. Check the definitions of required variables.
- 6. Generate a run directory for GSI (sometimes called a working or temporary directory).
- 7. Copy the GSI executable to the run directory.
- 8. Copy the background file to the run directory and create an index file listing the location and name of ensemble members if running with a hybrid set up.
- 9. Link observations to the run directory.
- 10. Link fixed files (statistic, control, and coefficient files) to the run directory.
- 11. Generate namelist for GSI.
- 12. Run the GSI executable.
- 13. Post-process: save analysis results, generate diagnostic files, and clean the run directory.
- 14. Run GSI as observation operator for EnKF, only for if_observer=Yes.

Typically, users only need to modify specific parts of the run script (steps 1, 2, and 3) to fit their specific computer environment and point to the correct input/output files and directories. Users may also need to modify step 4 if changes are made to the namelist and it is under a different name or at a different location. The next section (3.2.2) covers each of these modifications for steps 1 to 3. Section 3.2.3 will dissect a sample regional GSI run script and introduce each piece of this sample GSI run script. Users should start with the run script provided in the same release package with the GSI executable and modify it for their own run environment and case configuration.

3.2.2 Customization of the GSI Run Script

3.2.2.1 Setting Up the Machine Environment

This section focuses on step 1 of the run script: modifying the machine specific entries. Specifically, this consists of setting Unix/Linux environment variables and selecting the correct parallel run time environment (batch system with options).

GSI can be run with the same parallel environments as other MPI programs, for example:

- IBM supercomputer using LSF (Load Sharing Facility)
- IBM supercomputer using LoadLevel
- Linux clusters using PBS (Portable Batch System)
- Linux clusters using LSF

- Linux workstation (no batch system)
- Intel Mac Darwin workstation with PGI complier (no batch system)

Two queuing systems are listed below as examples:

Machine &	Linux Cluster with LSF	Linux Cluster with PBS	Workstation
queue system			
example			No batch sys-
	#BSUB -P ??????? #BSUB -W 00:10 #BSUB -n 4 #BSUB -R "span[ptile=16] #BSUB -J gsi #BSUB -o gsi.%J.out #BSUB -e gsi.%J.err #BSUB -q small	<pre>#PBS -1 procs=4 #PBS -n #PBS -0 gsi.out #PBS -e gsi.err #PBS -N GSI #PBS -1 walltime=00:20 #PBS -A ??????</pre>	tem, skip this step

In both of the examples above, environment variables are set specifying system resource management, such as the number of processors, the name/type of queue, maximum wall clock time allocated for the job, options for standard out and standard error, etc. Some platforms need additional definitions to specify Unix environment variables that further define the run environment.

These variable settings can significantly impact the GSI run efficiency and accuracy of the GSI results. Please check with your system administrator for optimal settings for your computer system. Note that while the GSI can be run with any number of processors, it will not scale well with the increase of processor numbers after a certain threshold based on the case configuration and GSI application types.

3.2.2.2 Setting up the Running Environment

There are only two options to define in this block.

The option ARCH selects the machine architecture. It is a function of platform type and batch queuing system. The option GSIPROC sets the number of cores used in the run. This option also decides if the job is run as a multiple core job or as a single core run. Several choices of the option ARCH are listed in the sample run script. Please check with your system administrator about running parallel MPI jobs on your system.

3.2.2.3 Setting Up an Analysis Case

Option ARCH	Platform	Compiler	batch queuing system
IBM_LSF	IBM AIX	xlf, xlc	LSF
LINUX	Linux workstation	Intel/PGI/GNU	mpirun if GSIPROC > 1
LINUX_LSF	Linux cluster	Intel/PGI/GNU	LSF
LINUX_PBS	Linux cluster	Intel/PGI/GNU	PBS
DARWIN_PGI	MAC DARWIN	PGI	mpirun if GSIPROC > 1

This section discusses setting up variables specific to a given case, such as analysis time, working directory, background and observation files, location of fixed files and CRTM coefficients, the GSI executable file, and the script generating GSI namelist.

```
# case set up (users should change this part)
# ANAL_TIME= analysis time (YYYYMMDDHH)
# WORK_ROOT= working directory, where GSI runs
# PREPBURF = path of PreBUFR conventional obs
# BK_FILE = path and name of background file
# OBS_ROOT = path of observations files
# FIX_ROOT = path of fix files
\# GSI_EXE = path and name of the gsi executable
# ENS_ROOT = path where ensemble background files exist
 ANAL_TIME=2017051318
 JOB_DIR=the_job_directory
    #normally you put run scripts here and submit jobs form here,
    #require a copy of gsi.x at this directory
 RUN_NAME=a_descriptive_run_name_such_as_case05_3denvar_etc
 OBS_ROOT=the_directory_where_observation_files_are_located
 BK_ROOT=the_directory_where_background_files_are_located
 GSI_ROOT=the_comgsi_main directory where src/ ush/ fix/ etc are located
 CRTM_ROOT=the_CRTM_directory
 ENS_ROOT=the_directory_where_ensemble_backgrounds_are_located
     #ENS_ROOT is not required if not running hybrid EnVAR
 HH='echo $ANAL_TIME | cut -c9-10'
 GSI_EXE=${JOB_DIR}/gsi.x #assume you have a copy of gsi.x here
 WORK_ROOT=${JOB_DIR}/${RUN_NAME}
 FIX_ROOT=${GSI_ROOT}/fix
 GSI_NAMELIST=${GSI_ROOT}/ush/comgsi_namelist.sh
 PREPBUFR=${OBS_ROOT}/nam.t${HH}z.prepbufr.tm00
 BK_FILE=${BK_ROOT}/wrfinput_d01.${ANAL_TIME}
```

When picking the observation BUFR files, please be aware of the following:

- GSI run will stop if the time in the background file does not match the cycle time in the observation BUFR file used for the GSI run (there is a namelist option to turn this verification step off).
- Since release version 3.2, the BUFRLIB in the GSI package compiled with PGI and Intel can automatically handle byte order issues in PrepBUFR and BUFR files. The BUFRLIB in this version GSI can works with GNU also.

The next part of this block focuses on additional options that specify important aspects of

the GSI configuration.

```
#-----
# bk_core= which WRF core is used as background (NMM or ARW or NMMB)
# bkcv_option= which background error covariance and parameter will be used
              (GLOBAL or NAM)
# if_clean = clean : delete temperal files in working directory (default)
           no
                  : leave running directory as is (this is for debug only)
# if_observer = Yes : only used as observation operator for enkf
# if_hybrid = Yes : Run GSI as 3D/4D EnVar
# if_4DEnVar = Yes : Run GSI as 4D EnVar
# if_nemsio = Yes : The GFS background files are in NEMSIO format
# if_oneob = Yes : Do single observation test
 if_hybrid=No  # Yes, or, No -- case sensitive !
 if_4DEnVar=No  # Yes, or, No -- case sensitive (set if_hybrid=Yes first)!
 if_observer=No # Yes, or, No -- case sensitive !
 if_nemsio=No  # Yes, or, No -- case sensitive !
if_oneob=No  # Yes, or, No -- case sensitive !
 bk_core=ARW
 bkcv_option=NAM
 if_clean=clean
# setup whether to do single obs test
 if [ ${if_oneob} = Yes ]; then
   if_oneobtest='.true.'
   if_oneobtest='.false.'
 fi
# setup for GSI 3D/4D EnVar hybrid
 if [ ${if_hybrid} = Yes ] ; then
    PDYa='echo $ANAL_TIME | cut -c1-8'
    cyca='echo $ANAL_TIME | cut -c9-10'
    gdate='date -u -d "$PDYa $cyca -6 hour" +%Y%m%d%H' #guess date is 6hr ago
   gHH='echo $gdate | cut -c9-10'

# The following two only apply when if_observer = Yes, i.e. run observation operator for EnKF
# no_member    number of ensemble members
# BK_FILE_mem    path and base for ensemble members
    no_member=20
    BK_FILE_mem=${BK_ROOT}/wrfarw.mem#
```

Option if_hybrid controls whether to run a hybrid ensemble/variational data analysis. If if_hybrid=Yes, option if_4DEnVar=Yes indicates a hybrid 4D-EnVar analysis will be run, while if_4DEnVar=No indicates a hybrid 3DEnVAR analysis will be run. Option if_observer determines whether GSI is run as an observation operator for EnKF.

Option bk_core indicates the specific dynamic core used to create the background files and specifies the core in the namelist. Option bk_core can be ARW or NMMB. Option bkcv_option specifies the background error covariance to be used in the case. Two regional background error covariance matrices are provided with the release, one from NCEP global data assimilation (GDAS), and one from the NAM data assimilation system (NDAS). Please check Section 4.8 for more details about GSI background error covariance. Option if_clean tells the script if it needs to delete temporary intermediate files in the working directory after a GSI run is completed.

In most cases, users should only make minor changes after the following:

3.2.3 Description of the Sample Regional Run Script to Run GSI

Listed below is an annotated regional run script with explanations on each function block.

For further details on the first three blocks of the script that users need to change, see sections 3.2.2.1, 3.2.2.2, and 3.2.2.3:

3. Running GSI

```
GSIPROC=1
 ARCH='LINUX_LSF'

 BK_FILE_mem=${BK_ROOT}/wrfarw.mem
#
```

At this point, users should be able to run the GSI for simple cases without changing the scripts. However, some advanced users may need to change some of the following blocks for special applications, such as use of radiance data, cycled runs, specifying certain namelist variables, or running GSI on a platform not tested by the DTC.

The next block sets the run command for GSI on multiple platforms. The ARCH variable is set at the beginning of the script. Option BYTE_ORDER has been set as Big_Endian because GSI compiled to read a Big_Endian background error file, BUFR files, and CRTM coefficient files.

```
# Users should NOT make changes after this point
BYTE_ORDER=Big_Endian
# BYTE_ORDER=Little_Endian
case $ARCH in
  'IBM_LSF')
     ###### IBM LSF (Load Sharing Facility)
     RUN_COMMAND="mpirun.lsf " ;;
  'LINUX')
     if [ $GSIPROC = 1 ]; then
        #### Linux workstation - single processor
        RUN_COMMAND=""
        ##### Linux workstation - mpi run
       RUN_COMMAND="mpirun -np ${GSIPROC} -machinefile ~/mach "
     fi ;;
  'LINUX_LSF')
     ###### LINUX LSF (Load Sharing Facility)
     RUN_COMMAND="mpirun.lsf " ;;
  'LINUX_PBS')
     #### Linux cluster PBS (Portable Batch System)
     RUN_COMMAND="mpirun -np ${GSIPROC} " ;;
  'DARWIN_PGI')
     ### Mac - mpi run
     if [ $GSIPROC = 1 ]; then
        #### Mac workstation - single processor
        RUN_COMMAND=""
     else
        ###### Mac workstation - mpi run
        RUN_COMMAND="mpirun -np ${GSIPROC} -machinefile ~/mach "
     fi ;;
    print "error: $ARCH is not a supported platform configuration."
    exit 1 ;;
esac
```

The next block checks if all the variables needed for a GSI run are properly defined. These variables should have been defined in the first three parts of this script.

```
\mbox{\tt\#} Make sure ANAL_TIME is defined and in the correct format
if [ ! "${ANAL_TIME}" ]; then
 echo "ERROR: \$ANAL_TIME is not defined!"
  exit 1
# Make sure WORK_ROOT is defined and exists
if [ ! "${WORK_ROOT}" ]; then
  echo "ERROR: \$WORK_ROOT is not defined!"
  exit 1
# Make sure the background file exists
if [ ! -r "${BK_FILE}" ]; then
  echo "ERROR: ${BK_FILE} does not exist!"
  exit 1
fi
# Make sure OBS_ROOT is defined and exists
if [ ! "${OBS_ROOT}" ]; then
  echo "ERROR: \$OBS_ROOT is not defined!"
  exit 1
fi
if [ ! -d "${OBS_ROOT}" ]; then
  echo "ERROR: OBS_ROOT directory '${OBS_ROOT}' does not exist!"
# Set the path to the GSI static files
if [ ! "${FIX_ROOT}" ]; then
  echo "ERROR: \$FIX_ROOT is not defined!"
  exit 1
fi
if [ ! -d "${FIX_ROOT}" ]; then
  echo "ERROR: fix directory '${FIX_ROOT}' does not exist!"
  exit 1
fi
\ensuremath{\text{\#}} Set the path to the CRTM coefficients
if [ ! "${CRTM_ROOT}" ]; then
  echo "ERROR: \$CRTM_ROOT is not defined!"
  exit 1
if [ ! -d "${CRTM_ROOT}" ]; then
  echo "ERROR: fix directory '${CRTM_ROOT}' does not exist!"
  exit 1
fi
# Make sure the GSI executable exists
if [ ! -x "${GSI_EXE}" ]; then
  echo "ERROR: ${GSI_EXE} does not exist!"
  exit 1
# Check to make sure the number of processors for running GSI was specified
if [ -z "${GSIPROC}" ]; then
  echo "ERROR: The variable $GSIPROC must be set to contain the number of processors to run GSI"
  exit 1
fi
```

The next block creates a working directory (workdir) in which GSI will run. The directory should have enough disk space to hold all the files needed for this run. This directory is cleaned before each run, therefore, save all the files needed from the previous run before rerunning GSI.

```
# Create the work directory and cd into it
workdir=${WORK_ROOT}
echo " Create working directory: " ${workdir}
if [ -d "${workdir}" ]; then
 rm -rf ${workdir}
fi
mkdir -p ${workdir}
cd ${workdir}
echo " Copy GSI executable, background file, and link observation bufr to working directory"
# Save a copy of the GSI executable in the workdir
cp ${GSI_EXE} gsi.exe
# Bring over background field (it's modified by GSI so we can't link to it)
cp ${BK_FILE} ./wrf_inout
if [ ${if_4DEnVar} = Yes ] ; then
 cp ${BK_FILE_P1} ./wrf_inou3
 cp ${BK_FILE_M1} ./wrf_inou1
```

Note: You can link observation files to the working directory because GSI will not overwrite these files. The observations that can be analyzed in GSI are listed in the column "dfile" of the GSI namelist section OBS_INPUT, as specified in run/comgsi_namelist.sh. Most of the conventional observations are in one single file named prepbufr, while different radiance data are in separate files based on satellite instruments, such as AMSU-A or HIRS. All these observation files must be linked as GSI recognized file names in "dfile." Please check table 3.1 for a detailed explanation of links and the meanings of each file name listed below.

```
# Link to the prepbufr data
ln -s ${PREPBUFR} ./prepbufr
# ln -s ${OBS_ROOT}/gdas1.t${HH}z.sptrmm.tm00.bufr_d tmirrbufr

   ((ii = $ii + 1))
done
```

The following block copies constant fixed files from the fix/ directory and links CRTM coefficients. Please check Section 3.1 for the meanings of each fixed file.

```
echo " Copy fixed files and link CRTM coefficient files to working directory"
# Set fixed files
   berror = forecast model background error statistics
   specoef = CRTM spectral coefficients
#
   trncoef = CRTM transmittance coefficients
   emiscoef = CRTM coefficients for IR sea surface emissivity model
#
#
   aerocoef = CRTM coefficients for aerosol effects
   cldcoef = CRTM coefficients for cloud effects
   satinfo = text file with information about assimilation of brightness temperatures
#
#
   satangl = angle dependent bias correction file (fixed in time)
#
   pcpinfo = text file with information about assimilation of prepcipitation rates
   ozinfo = text file with information about assimilation of ozone data
#
   errtable = text file with obs error for conventional data (regional only)
#
   convinfo = text file with information about assimilation of conventional data
   bufrtable= text file ONLY needed for single obs test (oneobstest=.true.)
   bftab_sst= bufr table for sst ONLY needed for sst retrieval (retrieval=.true.)
```

Note: For background error covariances, observation errors, and analysis variable information, we provide two sets of fixed files. One set is based on GFS statistics and another is

based on NAM statistics. For this release there is an additional setting in the ANAVINFO file for "bk core" for both GFS and NAM statistics.

```
if [ ${bkcv_option} = GLOBAL ] ; then
  echo ' Use global background error covariance'

               ./CloudCoeff.bin
# Copy CRTM coefficient files based on entries in satinfo file
for file in 'awk '{if($1!~"!"){print $1}}' ./satinfo | sort | uniq'; do
  ln -s ${CRTM_ROOT_ORDER}/${file}.SpcCoeff.bin ./
   ln -s ${CRTM_ROOT_ORDER}/${file}.TauCoeff.bin ./
done
# Only need this file for single obs test
bufrtable=${FIX_ROOT}/prepobs_prep.bufrtable
cp $bufrtable ./prepobs_prep.bufrtable
# for satellite bias correction
# Users may need to use their own satbias files for correct bias correction
cp ${GSI_ROOT}/fix/comgsi_satbias_in ./satbias_in
cp ${GSI_ROOT}/fix/comgsi_satbias_pc_in ./satbias_pc_in
```

Please note that in the above sample script, two files related to radiance bias correction are copied to the work directory:

```
cp ${GSI_ROOT}/fix/comgsi_satbias_in ./satbias_in
cp ${GSI_ROOT}/fix/comgsi_satbias_pc_in ./satbias_pc_in
```

There are two options on how to perform the radiance bias correction. The first method is to do the angle dependent bias correction offline and do the mass bias correction inside the GSI analysis, therefore requiring two input files: satbias_angle, corresponding to the angle dependent bias correction file and satbias_in, being the input file for mass bias correction. The second method is to combine the angle dependent and mass bias correction together and do it within the GSI analysis, requiring one combined input file: satbias_in. Note that the input bias correction coefficients file, satbias_in, is different for the two options, therefore it is important to use the appropriate input file for each method. This vesion GSI only provide the second option - combined angle dependent and mass bias correction. A sample file, comgsi_satbias_in, is provided as an example. As a starting point, users may also download a GDAS satbias coefficient file from the NOMADS ftp site as the input file (starting in spring 2015, the GDAS satbias files have adopted the following format):

```
ftp://nomads.ncdc.noaa.gov/GDAS/YYYYMM/YYYYMMDD/gdas1.tHHz.abias
```

In order to use the combined angle dependent and mass bias correction, users also need to set adp_anglebc=.true. in the &SETUP section of the GSI namelist

(comgsi_namelist.sh). For more details about the namelist, please see Appendix C in this document.

Set up some constants used in the GSI namelist. Please note that bkcv_option is set for background error tuning. They should be set based on specific applications. Here we provide three sample sets of the constants for different background error covariance options, one set is used in the NAM operations, one for the GFS operations and one for the NMMB operations. In this release, the capability of NMMB application is included and therefore the namelist settings for NMMB are provided in addition to NMM and ARW applications.

```
# Set some parameters for use by the GSI executable and to build the namelist
echo " Build the namelist "
# default is NAM
# as_op='1.0,1.0,0.5 ,0.7,0.7,0.5,1.0,1.0,'
vs_op='1.0,'
hzscl_op='0.373,0.746,1.50,'
if [ ${bkcv_option} = GLOBAL ] ; then
   as_op='0.6,0.6,0.75,0.75,0.75,0.75,1.0,1.0'
  vs_op='0.7,'
  hzscl_op='1.7,0.8,0.5,'
fi
if [ ${bk_core} = NMMB ] ; then
  vs_op='0.6,'
fi
# default is NMM
  bk_core_arw='.false.'
  bk_core_nmm='.true.'
  bk_core_nmmb='.false.'
  bk_if_netcdf='.true.'
if [ ${bk_core} = ARW ] ; then
  bk_core_arw='.true.'
  bk_core_nmm='.false.'
  bk_core_nmmb='.false.'
  bk_if_netcdf='.true.'
if [ ${bk_core} = NMMB ] ; then
  bk_core_arw='.false.'
  bk_core_nmm='.false.'
  bk_core_nmmb='.true.'
  bk_if_netcdf='.false.'
```

The following section specifies the number of outer loops and whether to save GSI read observations based on the setting of "if_observer".

```
if [ ${if_observer} = Yes ] ; then
  nummiter=0
  if_read_obs_save='.true.'
  if_read_obs_skip='.false.'
```

fi

```
else
  nummiter=2
  if_read_obs_save='.false.'
  if_read_obs_skip='.false.'
```

The following section of the script is used to generate the GSI namelist called gsiparm.anl in the working directory. A detailed explanation of each variable can be found in Section 3.4 and Appendix C.

```
# Build the GSI namelist on-the-fly
. $GSI_NAMELIST
```

The following block modifies the anavinfo file so that its vertical levels are consistent with the wrf_inout file for WRF ARW or NMM. Users no longer need to manually modify the anavinfo file.

```
# modify the anavinfo vertical levels based on wrf_inout for WRF ARW and NMM
if [ ${bk_core} = ARW ] || [ ${bk_core} = NMM ] ; then
bklevels='ncdump -h wrf_inout | grep "bottom_top =" | awk '{print $3}' '
bklevels_stag='ncdump -h wrf_inout | grep "bottom_top_stag =" | awk '{print $3}' '
anavlevels='cat anavinfo | grep ' sf ' | tail -1 | awk '{print $2}' ' # levels of sf, vp, u, v, t,
anavlevels_stag='cat anavinfo | grep ' prse ' | tail -1 | awk '{print $2}' ' # levels of prse
sed -i 's/ '$anavlevels'/ '$bklevels'/g' anavinfo
sed -i 's/ '$anavlevels_stag'/ '$bklevels_stag'/g' anavinfo
fi
```

The following block runs GSI and checks if GSI has successfully completed.

The following block saves the analysis results with an understandable name and adds the analysis time to some output file names. Among them, "stdout" contains runtime output of GSI and wrf_inout is the resulting analysis file.

The following block collects the diagnostic files. The diagnostic files are merged and categorized based on outer loop and data type. Setting "write_diag" to true in the namelist directs GSI to write out diagnostic information for each observation. This information is very useful to check analysis details. Please check Appendix A.2 for the tool to read and analyze these diagnostic files.

```
# Loop over first and last outer loops to generate innovation
# diagnostic files for indicated observation types (groups)
#
# NOTE: Since we set miter=2 in GSI namelist SETUP, outer
         loop 03 will contain innovations with respect to
#
         the analysis. Creation of o-a innovation files
#
         is triggered by write_diag(3)=.true. The setting
#
         write_diag(1)=.true. turns on creation of o-g
#
         innovation files.
loops="01 03"

# hirs4_metop_b hirs4_n19 amusa_n19 mhs_n19"
listall='ls pe* | cut -f2 -d"." | awk '{print substr($0, 0, length($0)-3)}' | sort | uniq'
for type in $listall; do
    count='ls pe*${type}_${loop}* | wc -l'
    if [[ $count -gt 0 ]]; then
        cat pe*${type}_$${loop}* > diag_${type}_$${string}.${ANAL_TIME}}
    fi
    done
done
```

The following scripts clean the temporary intermediate files:

```
# Clean working directory to save only important files
ls -l * > list_run_directory
if [[ ${if_clean} = clean && ${if_observer} != Yes ]]; then
  echo 'Clean working directory after GSI run'
  rm -f *Coeff.bin  # all CRTM coefficient files
  rm -f pe0*  # diag files on each processor
  rm -f obs_input.*  # observation middle files
  rm -f siganl sigf03  # background middle files
  rm -f fsize_*  # delete temperal file for bufr size
fi
```

The following block of the script runs only for if_observer=Yes, which runs GSI as an observation operator for EnKF and without doing minimization. The script first renames the previous diagnostics files and GSI analysis file by appending .ensmean to the filenames to avoid these files being overwritten by the new GSI run.

Next, the script generates the namelist for each ensemble member.

```
# Build the GSI namelist on-the-fly for each member
nummiter=0
  if_read_obs_save='.false.'
  if_read_obs_skip='.true.'
. $GSI_NAMELIST
```

The rest of the script loops through the ensemble members to get the background ready, run GSI, and check the run status:

```
# Loop through each member
 loop="01"
 ensmem=1
  while [[ $ensmem -le $no_member ]];do
     rm pe0*
     print "\$ensmem is $ensmem"
     ensmemid='printf %3.3i $ensmem'
# get new background for each member
     if [[ -f wrf_inout ]]; then
       rm wrf_inout
     BK_FILE=${BK_FILE_mem}${ensmemid}
     echo $BK_FILE
     ln -s $BK_FILE wrf_inout
     echo 'Run GSI with' ${bk_core} 'for member ', ${ensmemid}
     case $ARCH in
        'IBM_LSF')
           $\{RUN_COMMAND\} ./gsi.exe < gsiparm.anl > stdout_mem$\{ensmemid\} 2>&1 ;;
           $\{RUN_COMMAND\} ./gsi.exe > stdout_mem$\{ensmemid\} 2>&1 ;;
     esac
# run time error check and save run time file status
     error=$?
     if [ ${error} -ne 0 ]; then
       echo "ERROR: ${GSI} crashed for member ${ensmemid} Exit status=${error}"
       exit ${error}
     fi
     ls -l * > list_run_directory_mem${ensmemid}
```

The following lines generate the diagnostics files for each member.

The following section is to move on to the next ensemble member and run GSI.

```
# next member
          (( ensmem += 1 ))
    done
fi
```

If this point is reached, the GSI successfully finishes and exits with status "0":

exit 0

3.3 GSI Analysis Result Files in Run Directory

Once the GSI run script is set up, it is ready to be submitted like any other batch job. When completed, GSI will create a number of files in the run directory. Below is an example of the files generated in the run directory from one of the GSI test case runs. This case was run to perform a regional GSI analysis with a WRF-ARW NetCDF background using conventional (prepbufr), radiance (AMSU-A, HIRS4, and MHS), and GPSRO data. The analysis time is 1200Z on 13 May 2017. Four processors were used. To make the run directory more readable, we turned on the clean option in the run script, which deleted all temporary intermediate files.

```

It is important to know which files hold the GSI analysis results, standard output, and diagnostic information. We will introduce these files and their contents in detail in the following chapter. The following is a brief list of what these files contain:

- *stdout* or *stdout.anl.(time)*: standard text output file. *stdout.anl.(time)* is a link to *stdout* with the analysis time appended. This is the most commonly used file to check the GSI analysis processes and contains basic and important information about the analyses. We will explain the contents of the *stdout* file in Section 4.1 and users are encouraged to read this file in detail to become familiar with the order of GSI analysis processing.
- wrf_inout or wrfanl.(time): analysis results if GSI completes successfully. It exists only if using WRF for the background. The wrfanl.(time) file is a link to wrf_inout with the analysis time appended. The format is the same as the background file.
- *diag_conv_anl.(time)*: binary diagnostic files for conventional and GPS RO observations at the final analysis step (analysis departure for each observation).
- diag_conv_ges.(time): binary diagnostic files for conventional and GPS RO observations before the initial analysis step (background departure for each observation)
- diag_(instrument_satellite)_anl: diagnostic files for satellite radiance observations at the final analysis step.
- *diag_(instrument_satellite)_ges*: diagnostic files for satellite radiance observations before the initial analysis step.
- gsiparm.anl: GSI namelist, generated by the run script.
- fit_(variable).(time): links to fort.2?? with meaningful names (variable name plus analysis time). They are statistic results of observation departures from background and analysis results according to observation variables. Please see Section 4.5 for more details.
- fort.220: output from the inner loop minimization (in pcgsoi.f90). Please see Section 4.6 for details.
- anavinfo: info file to set up control, state, and background variables. Please see the Advanced GSI User's Guide for details.
- *info (convinfo, satinfo, ...): info files that control data usage. Please see Section 4.3 for details.
- *berror_stats* and *errtable*: background error file (binary) and observation error file (text).
- *bufr: observation BUFR files linked to the run directoryi. Please see Section 3.1 for details
- satbias_in: the input coefficients of bias correction for satellite radiance observations.
- *satbias_out*: the output coefficients of bias correction for satellite radiance observations after the GSI run.
- *satbias_pc_in*: the input coefficients of bias correction for passive satellite radiance observations.
- *list_run_directory*: the complete list of files in the run directory before cleaning takes place. This is generated by the GSI run script.

The diag files, such as diag_(instrument_satellite)_anl.(time) and diag_conv_anl.(time), contain important information about the data used in the GSI, including observation departure from analysis results for each observation (O-A). Similarly, diag_conv_ges and diag_(instrumen_satellite)_ges.(time) include the observation innovation for each observation (O-B). These files can be very helpful in understanding the detailed impact of data on the analysis. A tool is provided to process

these files, which is introduced in Appendix A.2.

There are many intermediate files in this directory while GSI is running or if the run crashes. The complete list of files in the directory (prior to cleaning) is saved in file list_run_directory. Some knowledge about the content of these files is very helpful for debugging if the GSI run crashes. Please check table 3.4 for the meaning of these files. (Note: you may not see all the files in the list because different observational data are used. Also, the fixed files prepared for a GSI run, such as CRTM coefficient files, are not included.)

File name	Content
sigf03	This is a temporary file, holding binary format back-
3-3-1	ground files (typically sigf03, sigf06 and sigf09 if FGAT
	used). When you see this file, at the minimum, a back-
	ground file was successfully read in.
siganl	Analysis results in binary format. When this file exists,
	the analysis has finished.
pe????.(conv or instru-	Diagnostic files for conventional and satellite radiance
ment_satellite)_(outer loop)	observations at each outer loop and each sub-domain
, ,	(????=subdomain id)i.
obs_input.????	Observation scratch files (each file contains observations
_	for one observation type within the whole analysis domain
	and time window. ????=observation type id in namelist).
pcpbias_out	Output precipitation bias correction file.

Table 3.4: List of GSI intermediate files

3.4 Introduction to Frequently Used GSI Namelist Options

The complete namelist options and their explanations are listed in Appendix C. For most GSI analysis applications, only a few namelist variables need to be changed. Here we introduce frequently used variables for regional analyses:

3.4.1 Set Up the Number of Outer and Inner Loops

To change the number of outer loops and the number of inner iterations in each outer loop, the following three variables in the namelist need to be modified:

- miter: number of outer analysis loops.
- niter(1): maximum iteration number of inner loop iterations for the 1st outer loop. The inner loop will stop when it reaches this maximum number, when it reaches the convergence threshold, or when it fails to converge.
- niter(2): maximum iteration number of inner loop iterations for the 2nd outer loop.
- If miter is larger than two, repeat niter with larger index.

3.4.2 Set Up the Analysis Variable for Moisture

There are two moisture analysis variable options. It is based on the following namelist variable:

qoption = 1 or 2:

- If qoption=1, the moisture analysis variable is pseudo-relative humidity. The saturation specific humidity, qsatg, is computed from the guess and held constant during the inner loop. Thus, the relative humidity control variable can only change via changes in specific humidity, q.
- If qoption=2, the moisture analysis variable is normalized relative humidity. This formulation allows relative humidity to change in the inner loop via changes to surface pressure, temperature, or specific humidity.

3.4.3 Set Up the Background File

The following four variables define which background field will be used in the GSI analyses:

- regional: if true, perform a regional GSI run using either ARW or NMM inputs as the background. If false, perform a global GSI analysis. If either wrf_nmm_regional or wrf_mass_regional are true, it will be set to true.
- wrf_nmm_regional: if true, the background comes from WRF-NMM. When using other background fields, set it to false.
- wrf_mass_regional: if true, the background comes from WRF-ARW. When using other background fields, set it to false.
- nems_nmmb_regional: if true, the background comes from NMMB. When using other background fields, set it to false.
- netcdf: if true, WRF files are in NetCDF format, otherwise WRF files are in binary format. This option only works for a regional GSI analysis.

3.4.4 Set Up the Output of Diagnostic Files

The following variables tell the GSI to write out diagnostic results in certain loops:

- write_diag(1): if true, write out diagnostic data in the beginning of the analysis, so that we can have information on observation background (O-B) differences.
- write_diag(2): if true, write out diagnostic data at the end of the 1st outer loop (before the 2nd outer loop starts).
- write_diag(3): if true, write out diagnostic data at the end of the 2nd outer loop (after the analysis finishes if the outer loop number is two), so that we can have information on observation analysis (O-A) differences.

Please check appendix A.2 for the tools to read the diagnostic files.

3.4.5 Set Up the GSI Recognized Observation Files

The following sets up the GSI recognized observation files for GSI observation ingest:

OB	S_INPUT::						
!	dfile	dtype	dplat	dsis	dval	${\tt dthin}$	dsfcalc
	prepbufr	ps	null	ps	1.0	0	0
	prepbufr	t	null	t	1.0	0	0
	prepbufr	q	null	q	1.0	0	0
	prepbufr	pw	null	pw	1.0	0	0
	satwndbufr	uv	null	uv	1.0	0	0
	prepbufr	uv	null	uv	1.0	0	0
	prepbufr	spd	null	spd	1.0	0	0
	prepbufr	dw	null	dw	1.0	0	0
	radarbufr	rw	null	rw	1.0	0	0
	prepbufr	sst	null	sst	1.0	0	0
	gpsrobufr	gps_ref	null	gps	1.0	0	0
	ssmirrbufr	pcp_ssmi	dmsp	pcp_ssmi	1.0	-1	0

- dfile: GSI recognized observation file name. The observation file contains observations used for a GSI analysis. This file can include several observation variables from different observation types. The file name listed by this parameter will be read in by GSI. This name can be changed as long as the name in the link from the BUFR/Prep-BUFR file in the run scripts also changes correspondingly.
- dtype: analysis variable name that GSI can read in. Please note this name should be consistent with that used in the GSI code.
- dplat: sets up the observation platform for a certain observation, which will be read in from the file dfile.
- dsis: sets up the data name (including both data type and platform name) used inside GSI.

Please see Section 4.3 for examples and explanations of these variables.

3.4.6 Set Up Observation Time Window

In the namelist section OBS_INPUT, use time_window_max to set the maximum half time window (hours) for all data types. In the convinfo file, you can use the column "twindow" to set the half time window for a certain data type (hours). For conventional observations, only observations within the smaller window of these two will be kept for further processing. For others, observations within time_window_max will be kept for further processing.

3.4.7 Set Up Data Thinning

1) Radiance data thinning

Radiance data thinning is controlled through two GSI namelist variables in the section &OBS_INPUT. Below is an example:

```
&OBS INPUT
  dmesh(1)=120.0,dmesh(2)=60.0,dmesh(3)=30,time_window_max=1.5,ext_sonde=.true.,
OBS_INPUT::
! dfile
                dtype
                           dplat

```

The two namelist variables that control the radiance data thinning are real array "dmesh" in the 1^{st} line and the "dthin" values in the 6^{th} column. The "dmesh" array sets mesh sizes for radiance thinning grids in kilometers, while "dthin" defines if the data type it represents needs to be thinned and which thinning grid (mesh size) to use. If the value of dthin is:

- an integer less than or equal to zero, no thinning is needed
- an integer larger than zero, this kind of radiance data will be thinned using the mesh size defined as dmesh (dthin).

The following section provides several thinning examples defined by the above sample &OBS_INPUT section:

- Data type ps from prepbufr: no thinning because dthin=0
- Data type gps_ref from gpsrobufr: no thinning because dthin=0
- Data type pcp_ssmi from dmsp: no thinning because dthin(01)=-1
- Data type hirs3 from NOAA-17: thinning in a 120 km grid because dthin=1 and dmesh(1)=120
- Data type hirs4 from metop-a: thinning in a 60 km grid because dthin=2 and dmesh(2)=60

2) Conventional data thinning

The conventional data can also be thinned. However, the setup of thinning is not in the namelist. To give users a complete picture of data thinning, conventional data thinning is briefly introduced here. There are three columns, ithin, rmesh, pmesh, in the convinto file (more details on this file are in Section 4.3) to configure conventional data thinning:

- ithin: 0 = no thinning; 1 = thinning with grid mesh decided by rmesh and pmesh
- rmesh: horizontal thinning grid size in km
- pmesh: vertical thinning grid size in mb; if 0, then use background vertical grid.

3.4.8 Set Up Background Error Factor

In the namelist section BKGERR, vs is used to set up the scale factor for vertical correlation length and hzscl is defined to set up scale factors for horizontal smoothing. The scale factors for the variance of each analysis variables are set in the anavinfo file. The typical values used in operations for regional and global background error covariance are given and picked based on the choice of background error covariance in the run scripts and sample anavinfo files

3.4.9 Single Observation Test

To do a single observation test, the following namelist option has to be set to true:

oneobtest=.true.

Then go to the namelist section SINGLEOB_TEST to set up the single observation location and variable to be tested, please see Section 4.2 for an example and details on the single observation test.

4

GSI Diagnostics and Tuning

The guidance in this chapter will help users understand how and where to check output from GSI to determine whether a run was successful. Properly checking the GSI output will also provide useful information to diagnose potential errors in the system. This chapter starts with an introduction to the content and structure of the GSI standard output file: (stdout). It continues with the use of a single observation to check the features of the GSI analysis. Then, observation usage control, analysis domain partitioning, fit files, and the optimization process will all be presented from information within the GSI output files (including stdout).

This chapter follows a case example for 2014061700. This case uses a WRF-ARW NetCDF file as the background and analyzes several observations typical for operations, including most conventional observation data, several radiance data sets (AMSU-A, HIRS4, and MHS), and GPSRO data. The case was run on a Linux cluster supercomputer, using four processors. Users can execute this test to reproduce the following results by visiting:

http://www.dtcenter.org/com-GSI/users/tutorial/index.php

4.1 Understanding Standard Output (stdout)

In Section 3.3, we listed the files present in the GSI run directory following a successful GSI analysis and briefly introduced the contents of several important files. Of these, **stdout** is the most useful because critical information about the GSI analysis can be obtained from the file. From **stdout**, users can check if the GSI has successfully completed, if optimal iterations look correct, and if the background and analysis fields are reasonable. Understanding the

content of this file can also be very helpful for users to find where and why the GSI failed if it crashes.

The structure of **stdout** follows the typical steps of a meteorological data analysis system:

- 1. Read in all data and prepare analysis:
 - Read in configuration (namelist)
 - · Read in the background
 - Read in observations
 - Partition domain and data for parallel analysis
 - Read in constant fields (fixed files)
- 2. Calculate observation innovations
- 3. Optimal iteration (analysis)
- 4. Save analysis results

In this section, the detailed structure and content of **stdout** are explained using the online example case 5: Hybrid 3DEnVar with all observations. To keep the output concise and make it more readable, most repeated content was deleted (shown with a dotted line). For the same reason, the precision of some numbers has been reduced to avoid line breaks in **stdout**.

The following indicates the start of the GSI analysis. It shows the date and time that GSI started running:

The following shows the content of anavinfo, a list of state and control variables:

```

Next is the content of all namelist variables used in this analysis. The 1st part shows 4DVAR setup information. Please note that while this version of the GSI includes a 4DVAR option, it remains untested. The general setup for the GSI analysis (3DVAR, 3D/4D EnVar) is located in the &SETUP section of the GSI namelist. Please check Appendix C for definitions and default values of each namelist variable.

```

This version of GSI attempts to read multiple time level backgrounds for option FGAT (First Guess at Appropriate Time), however we only have provided one time level in this test case. Therefore, there is an error message while reading background that does not exist:

```
CONVERT_NETCDF_MASS: problem with flnm1 = wrf_inou1, Status = -1021
```

We can ignore errors for missing files *wrf_inou1*, ..., *wrf_inou9*, because we are only running hybrid 3D EnVAR with one background.

Next, the background fields for the analysis are read in, and the maximum, minimum, and median values of the fields at each vertical level are displayed. Here, only part of the variables ZNU and T are shown, with all other variables read by the GSI listed solely as the variable name in the NetCDF file (rmse_var = T). Maximum and minimum values are useful for a quick verification that the background fields have been read successfully. From this section, we also know the time (iy,m,d,h,m,s) and dimension (nlon,lat,sig_regional) of the background field.

```

Again, some error information on missing background files shows up. Ignore if you are not doing FGAT.

```
CONVERT_NETCDF_MASS: problem with flnm1 = wrf_inou4, Status = -1021
```

Following this is information on the byte order of the binary background files. Since we used a NetCDF file, there is no need to be concerned with byte order. When using a binary format background, byte-order can be a problem. Beginning with the release version v3.2, GSI can automatically check the background byte-order and read it in the right order:

```
in convert_regional_guess, for wrf arw binary input, byte_swap= F
```

Information on setting the grid related variables, and the beginning and ending indices for thread one:

```
INIT_GRID_VARS: number of threads
INIT_GRID_VARS: for thread 1 jtstart,jtstop = 1 97
```

Information on the initial pointer location for each variable in the Jacobian for the use of satellite radiance data:

Vars in Rad-Jacobian (dims)	
sst	0
u	1
v	2
tv	3
q	35
oz	67

The following shows some output for debug. Those lines start with core numbers, such as [000]. We will not discuss those debug information but there are many similar lines in stdout file:

```
[000]gsisub(): : starting ...
[000]gsisub(): init_pass = T
[003]gsisub(): iadate(5)= 0
```

Starting subroutine *gsisub* (major GSI control subroutine) and displaying the analysis and background file time (they should be the same):

```
2018

Show observation observer as successfully initialized and inquire about the control vectors (space for analysis variables).

```
observer_init: successfully initialized
control_vectors: length= 2064450
control_vectors: currently allocated= 0
control_vectors: maximum allocated= 0
control_vectors: number of allocates= 0
control_vectors: number of deallocates= 0
control_vectors: Estimated max memory used= 0.0 Mb
```

Show the source of observation error used in the analysis (details see Section 4.7.1):

```
CONVERR: using observation errors from user provided table
```

The following information is related to the observation ingest processes, which is distributed over all the processors with each processor reading in at least one observation type. To speed up the reading process, some of the large datasets will use more than one (ntasks) processor for the ingest process.

Before reading in data from BUFR files, GSI checks the file status to insure the observation time matches the analysis time and whether the namelist option offtime_data is set (can be used to turn off the time consistency check between observation and analysis time). This step also checks for consistency between the satellite radiance data types in the BUFR files and the usage setups in the satinfo files. The following shows **stdout** information from this step:

```
read_obs_check: bufr file date is 2018081212 prepbufr t

```

Using the above output information, many details on the observations can be obtained. For example, the last line indicates that subroutine *READ_BUFRTOVS* was called to read in METOP-B AMSU-A (sis=amsua_metop-b) data from the BUFR file *amsuabufr* (file=amsuabufr). Furthermore, there are 13335 observations in this file (nread=13335) and 10112 in the analysis domain and within the time window (nkeep=10112). The data was thinned on a 60 km coarse grid (rmesh=60.000000).

The next step partitions observations into subdomains. The observation distribution is summarized below by listing the number of observations for each variable per subdomain (see Section 4.4 for more information):

```

From this point forward in the **stdout** file, the output shows many repeated entries. This is because the information is written from inside the outer loop. Typically the outer loop is run twice.

For each outer loop, the work begins with the calculation of the observation innovation. This calculation is done by the subroutine **setuprhsall**, which sets up the right hand side (rhs) of the analysis equation. This information is contained within the **stdout** file, which is shown in the following sections:

Start the first outer analysis loop:

```
GLBSOI: jiter, jiterstart, jiterlast, jiterend= 1 1 2 1
```

Calculate observation innovation for each data type in the first outer loop. When computing the radiance observation innovation, information on reading in CRTM coefficients follows SETUPALL information. In the **stdout** file, only information related to available radiance data are printed. The complete innovation information can be found in the diagnostic files for each observation (for details see Appendix A.2):

The inner iteration of the first outer loop is discussed in the example below. In this example, the maximum number of iterations is 50.

Print cost function values for each inner iteration (see section 4.6 for more details):

```

```

Calculate observation innovations for each data type in the second outer loop. When calculating the radiance data innovation, there is no need to read in CRTM coefficients again because they were already read in during the first outer loop:

Start the second outer loop.

```
RGLBSOI: START pcgsoi jiter=
```

The output from the inner iterations in the second outer loop is shown below. In this example, the maximum number of iterations is 50.

Print cost function values for each inner iteration (see section 4.6 for more details):

```
GLBSOI: START pcgsoi jiter=

```

Because the outer loop is set to two, the completion of the 2nd outer loop marks the end of the analysis. The next step is to save the analysis results. Again, only a portion of variable "T" is shown and all other variables are listed according to variable name in the NetCDF file (rmse_var = T). The maximum and minimum values are useful information for a quick sanity check of the analysis:

```

Different GSI applications may write out slightly different **stdout** file information but the major flow and information are the same. A good knowledge of the **stdout** file gives users a clear picture of how GSI runs and the key information provided during a GSI run like data distribution and inner iterations.

4.2 Single Observation Test

A single observation test is a GSI where only one (pseudo) observation is assimilated from a specific time and location within the analysis domain. By examining the analysis increments from a single observation test, one can visualize the important features of the analysis, such as the ratio of background error and observation error variance and the pattern of the background error covariance. Therefore, the single observation test is the first thing that users should run after successfully installing the GSI.

4.2.1 Setup a Single Observation Test

To perform the single observation test with the GSI, the following GSI namelist variables need to be set, which should be done through editing the script ush/comgsi_run_regional.ksh and ush/comgsi_namelist.sh:

In *ush/comgsi_run_regional.ksh*, turn on the single observation test:

```
if_oneob=Yes # Yes, or, No -- case sensitive !
```

In *ush/comgsi_namelist.sh*, set up single observation features like:

```
maginnov=1.0,
magoberr=0.8,
oneob_type='t',
oblat=38.,
oblon=262.,
obpres=500.,
obdattim= 2014061700,
obhourset=0.,
```

Note:

- Please check Appendix C in the User's Guide for the explanation of each parameter. From these parameters, we can see that a useful observation in the analysis should include information like the observation type (oneob_type), value (maginnov), observation error (magoberr), location (oblat, oblong, obpres), and time (obdattim, obhourset). Users can dump out (use ncdump) the global attributes from the NetCDF background file and set oblat=CEN_LAT, oblong=360-CEN_LON to have the observation at the center of the domain.
- In the analysis, the GSI first generates a prepbufr file including only one observation based on the information given in the namelist &SINGLEOB_TEST section. To generate this prepbufr file, the GSI needs to read in a PrepBUFR table, which is not needed when running a GSI analysis with real observations. The BUFR table is in the fix/directory and needs to be copied to the run directory. We have put the following lines in the GSI run script for the single observation test:

```
bufrtable=${FIX_ROOT}/prepobs_prep.bufrtable
cp $bufrtable ./prepobs_prep.bufrtable
```

4.2.2 Examples of Single Observation Tests for GSI

Figure 4.1 is a single observation test that has a temperature observation (oneob_type='t') with a one degree innovation (maginnov=1.0) and a 0.8 degree observation error (magoberr=0.8). The background error covariance converted from global (GFS) BE was picked to provide for better illustration.

This single observation was located at the center of the domain. The results are shown with figures of the horizontal and vertical cross sections through the point of maximum analysis increment. The Figure 4.1 was generated using NCL scripts, which can be found in the <code>util/Analysis_Utilities/plots_ncl</code> directory, introduced in Section A.4.

4.3 Control Data Usage

Observation data used in the GSI analysis can be controlled through three parts of the GSI system:

- 1. In the GSI run script, by linking observation BUFR files to the working directory
- 2. In section &OBS_INPUT of the GSI namelist (inside comgsi_namelist.sh)
- 3. Through parameters in info files (e.g.: convinfo, satinfo, etc.)

Each part provides different levels of control for data usage in the GSI, which is introduced below:

1. Link observation BUFR files to the working directory in the GSI run script:

All BUFR/PrepBUFR observation files need to be linked to the working directory with GSI recognizable names before they can be used in a GSI analysis. The run script (run_gsi_regional.ksh) makes these links after locating the working directory. Turning these links on or off can control the use of all the data contained in the BUFR files. Table 4.1 provides a list of all default observation file names recognized by GSI and the corresponding examples of the observation BUFR files from NCEP. The following is the first three rows of the table as an example:

Table 4.1: List of all default observation file names recognized by GS	I.
--	----

GSI Name	Content	Example file names
prepbufr	Conventional observations, including ps, t, q, pw,	gdas1.t12z.prepbufr
	uv, spd, dw, sst, from observation platforms such as	
	METAR, soundings, etc.	
satwndbufr	satellite winds	gdas1.t12z.satwnd.tm00.bufr_d
amsuabufr	AMSU-A lb radiance (brightness temperatures) from	gdas1.t12z.1bamua.tm00.bufr_d
	satellites NOAA-15, 16, 17,18, 19, and METOP-A/B	

The left column is the GSI recognized name (bold) and the right column are names of BUFR files from NCEP (italic). In the run script, the following lines are used to link the

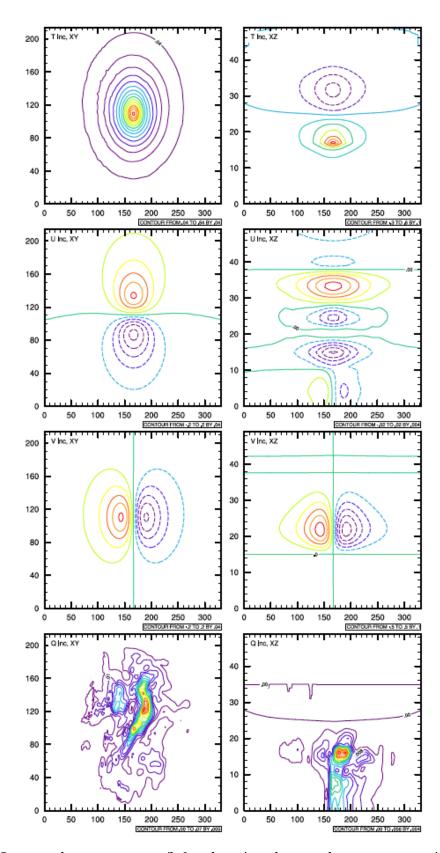

Figure 4.1: Horizontal cross sections (left column) and vertical cross sections (right column) of analysis increment of T, U, V, and Q from a single T observation

BUFR files in the right column to the working directory using the GSI recognized names

shown in the left column:

```
# Link to the prepbufr data
ln -s ${PREPBUFR} ./prepbufr

# Link to the radiance data
ln -s ${OBS_ROOT}/gdas1.t12z.1bamua.tm00.bufr_d amsuabufr
```

The GSI recognized default observation filenames are set up in the namelist section &OBS_INPUT, which can be changed based on application needs (see below for details).

2. In the GSI namelist (inside *comgsi_namelist.sh*), section &OBS_INPUT:

In this namelist section, observation files ("dfile" column) are tied to the observation variables used inside the GSI code ("dsis" column). For example, part of section OBS_INPUT shows:

```
&ORS INPIIT
   dmesh(1)=120.0,dmesh(2)=60.0,dmesh(3)=30,time_window_max=1.5,ext_sonde=.true.,
OBS_INPUT::
! dfile
                  dtype
                               dplat
                                          dsis
                                                                dval
                                                                         dthin dsfcalc
   prepbufr
                                                                1.0
                                                                        0
                  ps
                               null
                                          ps
                                                                               0
                               null
   prepbufr
                                                                1.0
                                                                        0
                                                                               0

                                                                        -1
                                                                               0
                                                               10.0
                                                                        2
   amsuabufr
                  amsua
                               n15
                                          amsua_n15
   {\tt amsuabufr}
                   amsua
                               n18
                                          amsua_n18
                                                               10.0
```

This setup tells GSI that conventional observation variables ps, t, and q should be read in from the file prepbufr, while AMSU-A radiances from NOAA-15 and NOAA-18 satellites should be read in from the file **amsuabufr**. Deleting a particular line in &OBS_INPUT will turn off the use of the observation variable presented by the line in the GSI analysis but other variables under the same type can still be used. For example, if we delete:

```
amsuabufr amsua n15 amsua_n15 10.0 2 0
```

Then, the AMSU-A observation from NOAA-15 will not be used in the analysis but the AMSU-A observations from NOAA-18 will still be used.

The observation filename in "dfile" can be different from the sample script (comgsi_namelist.ksh). If the filename in "dfile" has been changed, the link from the BUFR files to the GSI recognized name in the run script also needs to be changed correspondingly. For example, if we change the "dfile" in amsuabufr for NOAA-15 to be amsuabufr_n15,

```
amsuabufr_n15 amsua n15 amsua_n15 10.0 2 0 amsuabufr amsua n18 amsua_n18 10.0 2 0
```

Then a new link needs to be added in the run script:

```
# Link to the radiance data
ln -s ${OBS_ROOT}/le_gdas1.t00z.1bamua.tm00.bufr_d amsuabufr
ln -s ${OBS_ROOT}/le_gdas1.t00z.1bamua.tm00.bufr_d amsuabufr_n15
```

The GSI will read NOAA-18 AMSU-A observations from file amsuabufr and NOAA-15 AMSU-A observations from file amsuabufr_n15 based on the above changes to the run scripts and namelist. In this example, both amsuabufr and amsuabufr_15 are linked to the same BUFR file and NOAA-15 AMSU-A and NOAA-18 AMSU-A observations are still read in from the same BUFR file. If amsuabufr and amsuabufr_15 link to different BUFR files, then NOAA-15 AMSU-A and NOAA-18 AMSU-A will be read in from different BUFR files. The changeable filename in dfile gives GSI more flexibility to handle multiple data resources.

3. Use info files to control data usage

For each variable, observations can come from multiple platforms (data types or observation instruments). For example, surface pressure (ps) can come from METAR observation stations (data type 187) and rawinsonde (data type 120). There are several files named *info in the GSI system (located in ./fix) to control the usage of observations based on the observation platform. Table 4.2 is a list of info files and their function:

File name	Function and Content
in GSI	
convinfo	Control the usage of conventional data, including tcp, ps, t, q, pw, sst, uv, spd,
	dw, radial wind (Level 2 rw and 2.5 srw), gps, and pm2_5
satinfo	Control the usage of satellite data. Instruments include AMSU-A/B, HIRS3/4,
	MHS, ssmi, ssmis, iasi, airs, sndr, cris, amsre, imgr, seviri, atms, avhrr3, etc., and
	satellites include NOAA 15, 17, 18, 19, aqua, GOES 11, 12, 13, METOP-A/B, NPP,
	DMSP 15,16,17,18,19,20, M08, M09, M10, etc.
ozinfo	Control the usage of ozone data, including sbuv6, 8 from NOAA 14, 16, 17, 18, 19.
	omi_aura, gome_metop-a, and mls_aura
pcpinfo	Control the usage of precipitation data, including pcp_ssmi and pcp_tmi
aeroinfo	Control the usage of aerosol data, including modis_aqua and modis_terra

Table 4.2: The content of info files

The header of each info file includes an explanation of the content of the file. Here we discuss the two most commonly used info files:

• convinfo

The **convinfo** file controls the usage of conventional data. The following is part of the **convinfo** file:

!otype	type	sub	iuse	twindow	numgrp	ngroup	nmiter	gross	ermax	ermin	var_b	var_pg	ithin	rmesh	pmesh	npred	pmot	ptime
tcp	112	0	1	3.0	0	0	0	75.0	5.0	1.0	75.0	0.000000	0	0.	0.	0	0.	0.

t	131	0	1	3.0	0	0	0	7.0	5.6	1.3	7.0	0.001000	0	0.	0.	0	0.	0.

t	132	0	1	3.0	0	0	0	7.0	5.6	1.3	7.0	0.001000	0	0.	0.	0	0.	0.
t	133	0	1	3.0	0							0.004000				0	0.	0.
t	134	0	-1	3.0	0	0	0	7.0	5.6	1.3	7.0	0.004000	0	0.	0.	0	0.	0.
t	135	0	-1	3.0	0	0	0	7.0	5.6	1.3	7.0	0.004000	0	0.	0.	0	0.	0.
t	180	0	1	3.0	0	0	0	7.0	5.6	1.3	7.0	0.004000	0	0.	0.	0	0.	0.
t	180	01	1	3.0	0	0	0	7.0	5.6	1.3	7.0	0.004000	0	0.	0.	0	0.	0.
t	181	0	-1	3.0	0	0	0	7.0	5.6	1.3	7.0	0.004000	0	0.	0.	0	0.	0.
t	182	0	1	3.0	0	0	0	7.0	5.6	1.3	7.0	0.004000	0	0.	0.	0	0.	0.

The meaning of each column is explained in the header of the file and is listed in Table 4.3.

Table 4.3: list of the content for each convinfo column

Column	Content of the column
Name	
otype	observation variables (t, uv, q, etc.)
type	prepbufr observation type (if available)
sub	prepbufr subtype (not yet available)
iuse	flag if to use/not use / monitor data;
	= 1, use data, the data type will be read and used in the analysis after quality
	control;
	= 0, read in and process data, use for quality control, but do NOT assimilate;
	= -1, monitor data. This data type will be read in and monitored but not be used
	in the GSI analysis.
twindow	time window (+/- hours) for data used in the analysis
numgrp	cross validation parameter - number of groups
ngroup	cross validation parameter - group to remove from data use
nmiter	cross validation parameter - external iteration to introduce removed data
gross	gross error parameter - gross error
ermax	gross error parameter - maximum error
ermin	gross error parameter - minimum error
var_b	variational quality control parameter - b parameter
var_pg	variational quality control parameter - pg parameter
ithin	Flag to turn on thinning (0, no thinning, 1 - thinning)
rmesh	size of horizontal thinning mesh (in kilometers)
pmesh	size of vertical thinning mesh
npred	Number of bias correction predictors
pmot	Option to keep thinned data as monitored, 0: do not keep, other values: keep
ptime	time interval for thinning, 0, no temporal thinning, other values define time
	interval (less than six)

From this table, we can see that parameter "iuse" is used to control the usage of data and parameter "twindow" is used to control the time window of data usage. Parameters gross, ermax, and ermin are for gross quality control. Through these parameters, GSI can control how to use certain types of data in the analysis.

• satinfo

The *satinfo* file contains information about the channels, sensors, and satellites. It specifies observation error (cloudy or clear) for each channel, how to use the channels

(assimilate, monitor, etc), and other useful information. The following is part of the content of *satinfo*. The meaning of each column is explained in Table 4.4.

!sensor/instr/sat	chan	iuse	error	error_cld	ermax	var_b	var_pg	cld_det
amsua_n15	1	1	3.000	20.000	4.500	10.000	0.000	-2
amsua_n15	2	1	2.200	18.000	4.500	10.000	0.000	-2
amsua_n15	3	1	2.000	12.000	4.500	10.000	0.000	-2
amsua_n15	4	1	0.600	3.000	2.500	10.000	0.000	-2
amsua_n15	5	1	0.300	0.500	2.000	10.000	0.000	-2
amsua_n15	6	-1	0.230	0.300	2.000	10.000	0.000	-2
amsua_n15	7	1	0.250	0.250	2.000	10.000	0.000	-2
amsua_n15	8	1	0.275	0.275	2.000	10.000	0.000	-2
amsua_n15	9	1	0.340	0.340	2.000	10.000	0.000	-2
amsua_n15	10	1	0.400	0.400	2.000	10.000	0.000	-2
amsua_n15	11	-1	0.600	0.600	2.500	10.000	0.000	-2
amsua_n15	12	1	1.000	1.000	3.500	10.000	0.000	-2
amsua_n15	13	1	1.500	1.500	4.500	10.000	0.000	-2
amsua_n15	14	-1	2.000	2.000	4.500	10.000	0.000	-2
amsua_n15	15	1	3.500	15.000	4.500	10.000	0.000	-2
hirs3_n17	1	-1	2.000	0.000	4.500	10.000	0.000	-1
hirs3_n17	2	-1	0.600	0.000	2.500	10.000	0.000	1
hirs3_n17	3	-1	0.530	0.000	2.500	10.000	0.000	1

Table 4.4: list of the content for each satinfo column

Column Name	Content of the column
sensor/instr/sat	Sensor, instrument, and satellite name
chan	Channel number for certain sensor
iuse	= 1, use this channel data;
	=-1, don't use this channel data
error	Variance for each satellite channel
error_cld	Variance for each satellite channel if cloudy
ermax	Error maximum for gross check to observations
var_b	Possible range of variable for gross errors
var_pg	Probability of gross error
icld_det	Use this channel in cloud detection if > 0

4.4 Domain Partition for Parallelization and Observation Distribution

The standard output file (*stdout*) has an information block that shows the distribution of different kinds of observations in each sub-domain. This block follows the observation input section. The following is the observation distribution from the case shown in Section 4.1. From the introduction, we know the prepbufr (conventional data), radiance BUFR files, and GPS BUFR files were used. In this list, the conventional observations (ps, t, q, pw, and uv), GPSRO (gps_ref), and radiance data (amusa, hirs4, and mhs from Metop-a, Metop-b, NOAA 15, and 18) were distributed among four sub-domains:

OBS_PARA: ps	1429	3190	4655	6774
OBS_PARA: t	2564	5200	7057	11128
OBS_PARA: q	2346	4626	6148	8128

OBS_PARA:	pw		65	80	63	49
OBS_PARA:	uv		3358	6453	8091	11998
OBS_PARA:	gps_ref		1799	1368	2664	3520
OBS_PARA:	hirs4	metop-a	0	0	1146	1661
OBS_PARA:	hirs4	n19	213	1020	0	0
OBS_PARA:	hirs4	metop-b	0	0	85	555
OBS_PARA:	amsua	n15	1458	2026	830	234
OBS_PARA:	amsua	n18	2223	2318	108	0
OBS_PARA:	amsua	n19	176	960	0	0
OBS_PARA:	amsua	metop-a	0	0	1077	1559
OBS_PARA:	amsua	metop-b	0	0	265	1829
OBS_PARA:	mhs	n18	2550	2695	160	0
OBS_PARA:	mhs	n19	246	1103	0	0
OBS_PARA:	mhs	metop-a	0	0	1237	1809
OBS_PARA:	mhs	metop-b	0	0	321	2128

This list is a good way to quickly check which kinds of data are used in the analysis and how they are distributed in the analysis domain.

4.5 Observation Innovation Statistics

The GSI analysis provides a set of files named *fort.2** to summarize observations fit to the current solution in each outer loop (except for *fort.220*, see explanation in the next section). The content of some of these files is listed in Table 4.5:

To help users understand the information inside these files, some examples are given in the following sub-sections with corresponding explanations.

4.5.1 Conventional observations

Example of files, including single level data (fort.201, fort.205, and fort.213)

Please note that five layers from 600 to 150 hPa have been deleted to make each row fit into one line. Only observation type 220 and 223 are shown as an example.

Table 4.6 lists the meaning of each item in file *fort.201-213* except file *fort.207*:

The contents of the fit files are calculated based on O-B or O-A for each observation. The detailed departure information about each observation is saved in the diagnostic files. For the content of the diagnostic files, please check the content of the array "rdiagbuf" in one of the setup subroutines for conventional data (for example, setupt.f90). We provide a tool in appendix A.2 to help users read in the information from the diagnostic files.

These fit files give lots of useful information on how data are analyzed by the GSI, such as how many observations are used and rejected, the bias and root mean squared (RMS) error for certain data types or for all observations, and how analysis results fit to the observation before and after analysis. Again, we use observation type 220 in *fort.202* (*fit_w1.2014061700*)

Table 4.6: List of each item in file fort.201-213 (except fort.207).

4.0. List of each item in the fort.201-213 (except fort.207).
Explanation
outer loop number
= 01: observation - background
= 02: observation - analysis (after 1st outer loop)
= 03: observation - analysis (after 2 nd outer loop)
observation variable type (such as uv or ps) and usage,
which includes:
blank: used in GSI analysis
mon: monitored (read in but not assimilated by GSI)
rej: rejected because of quality control in GSI
prepbufr observation type (see the BUFR User's Guide for
details)
prepbufr observation subtype (not used)
for multiple level data: pressure at the top of the layer
for multiple level data: pressure at the bottom of the layer
the number of observations summarized under observa-
tion types and vertical layers
bias of observation departure for each outer loop (it)
root mean square error of observation departure for each
outer loop (it)
observation part of penalty (cost function)
nonlinear qc penalty

as an example to illustrate how to read this information. The fit information for observation type 220 (soundings) is listed below. Like the previous example, five layers from 600 to 150 hPa were deleted to make each row fit into one line. All fit information of observation type 220 is shown.

In loop section o-g 01, from the count line, we can see there were 4231 sounding observations used in the analysis. Among them, 44 were within the 1000-1200 hPa layer. Also from the count lines, in the rejection and monitoring section, there were 800 observations rejected and 29 observations monitored. In the same loop section, from the bias line and rms lines, we can see the total bias and RMS error of O-B for the sounding information is 0.59 and 4.18. The bias and RMS error for each vertical layer can also be found in this file.

Next we can see bias and RMS error values from different loops, as shown with the comparison in the following three lines:

```
o-g 01
                 220 0000
                                  2.21 2.48 2.51
                                                     2.84
                                                            5.88
                                                                  4.79
                                                                          4.18
          uv
                           rms
                           rms
                                 2.13
o-g 02
          uv
                 220 0000
                                        2.26
                                              2.29
                                                     2.56
                                                            5.19
                                                                  4.55
                                                                          3.73
o-g 03
                 220 0000
                           rms
                                  2.11
                                        2.17
                                               2.20
                                                     2.38
                                                            5.00
                                                                  4.46
                                                                          3.60
```

These three lines show that the RMS error reduced from 4.18 (o-g 01, which is O-B) to 3.73 (o-g 02, which is O-A after the 1st outer loop) and then to 3.60 (o-g 03, which is O-A after the 2nd outer loop, which is also the final analysis result). The reduction in the RMS error shows that observation type 220 (sounding) was used in the GSI analysis to modify the background fields to fit to the observations.

4.5.2 Satellite Radiance

The file *fort.207* is the fit file for radiance data. Its content includes important information about the radiance data analysis.

The first part of the file *fort.207* lists the content that corresponds to those in the file **satinfo**, which is the info file to control radiance data usage.

```

                                                                 -1.564773
```

Each channel has 12 coefficients listed in a line. Therefore, there are 2723 lines of radiance bias correction coefficients for all channels, though some of the coefficients are zero.

The 3rd part of the *fort.207* file is similar to other fit files with content repeated in three sections, providing detailed statistics about the data in stages before the 1st outer loop, between the 1st and 2nd outer loops, and after the 2nd outer loop. The results before the 1st outer loop are used here as an example to explain the content of the results:

• Summaries for various statistics as a function of observation type

Table 4.7: Summary of the radiance observation fit file (fort.207)

	, ,
Name	Explanation
sat	satellite name
type	instrument type
penalty	contribution to cost function from this observation type
nobs	number of good observations used in the assimilation
iland	number of observations over land
isnoice	number of observations over sea ice and snow
icoast	number of observations over coast
ireduce	number of observations that reduce qc bounds in tropics
ivarl	number of observations removed by gross check
nlgross	number of observation removed by nonlinear qc
qcpenalty	nonlinear qc penalty from this data type
qc1-7	number of observations whose quality control criteria has
	been adjusted by each qc method (1-7). For details, see the
	Radiance Chapter of the Advanced User's Guide
rad total	summary of penalty for all radiance observation types
penalty_all	
rad total	summary of qcpenalty for all radiance observation types
qcpenalty_all	
rad to-	summary of observations removed by nonlinear qc for all
tal failed	radiance observation types
nonlingc

Table 4.8 lists the meaning of each column in the above statistics:

Table 4.8: Content of fit statistics for each channel in the fort.207 file.

Column	Content
	Content
#	
1	series number of the channel in satinfo file
2	channel number for certain radiance observation type
3	radiance observation type (for example: amsua_n15)
4	number of observations (nobs) used in GSI analysis within
	this channel
5	number of observations (nobs) tossed by gross check
	within this channel
6	variance for each satellite channel
7	bias (observation-guess before bias correction)
8	bias (observation-guess after bias correction)
9	penalty contribution from this channel
10	square root of (observation-guess with bias correction)**2
11	standard deviation

• Final summary for each observation type

Table 4.9 lists the meaning of each column in the above statistics:

Similar to other fit files, a comparison between results from different outer loops can give us very useful information on how much impact each channel and data type has in the GSI.

	Content of the initial summary section for the fortizor. Inc.
Name	Explanation
it	stage (o-g 01 rad = before 1st outer loop for radiance data)
satellite	satellite name (n16=NOAA -16)
instrument	instrument name (HIRS-3)
# read	number of data (channels) read in within analysis time
	window and domain
# keep	number of data (channels) kept after data thinning
# assim	number of data (channels) used in analysis (passed all qc
	process)
penalty	contribution from this observation type to cost function
qcpnlty	nonlinear qc penalty from this data type
cpen	penalty divided by (the number of data assimilated)
qccpen	qcpnlty divided by (the number of data assimilated)

Table 4.9: Content of the final summary section for the fort.207 file.

4.6 Convergence Information

There are two ways to check the convergence information for each iteration of the GSI:

1. Standard output file (stdout):

The value of the cost function and norm of the gradient for each iteration are listed in the file *stdout*.

The following is an example showing the iterations from the first outer loop:

The following are the iterations from the second outer loop:

Here, we can see the number of outer and inner loops (minimization iteration). The meaning of the names (bold) used in *stdout* are explained in the following:

• cost: the cost function values, (=])

- grad: inner product of gradients (norm of the gradient (Y*X))
- step: stepsize
- b: parameter to estimate the new search direction

As a quick check, the cost function reduced from 3.915930707165839704E+04 to 2.479985164931967302E+04 in the $1^{\rm st}$ outer loop and reduced from 2.792919782749931983E+04 to 2.474335402213209454E+04 in the $2^{\rm nd}$ outer loop.

2. Convergence information in file *fort.220*:

In file *fort.220*, users can find more detailed minimization information about each iteration. A detailed description and example are provided in the Advanced User's Guide.

To evaluate the iteration convergence, we usually make plots based on the information from *fort.220*, such as the value of the cost function and the norm of the gradient. The following are example plots showing the evolution of the cost function and the norm of the gradient in different outer loops:

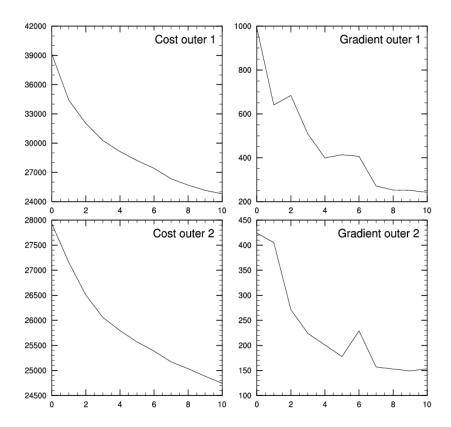

Figure 4.2: Evolution of the cost function (left column) and the norm of the gradient (right column) in the first outer loop (top row) and the second outer loop (bottom row). The Y-axis is the iteration number.

Scripts are available in the release code to read convergence information from *fort.220* and produce the above plots. Please see Section A.3 for information on where to locate and how to run these scripts.

4.7 Conventional Observation Errors

Each observation type has its own observation errors. In this section, we introduce several topics related to the conventional observation error processing in GSI. The observation error for satellite radiance and its adjustment is discussed in the Advanced User's Guide.

4.7.1 Getting Original Observation Errors

For the global GSI analysis, when oberrflg (a namelist option in section &obsqc) is true, observation errors are generated based on an external observation error table according to the observation type. Otherwise, observation errors are read in from the PrepBUFR file.

For regional analyses, GSI forces the use of an external observation error table to get observation errors no matter what the oberrflg is set to (oberrflg is forced to be true for regional runs in *gsimod.F90*).

The external observation error table file, *errtable*, includes observation errors for all types of conventional observations. It is copied from the ./fix directory by the run script. This release package has three sample external observation error table files, *nam_errtable.r3dv*, *prepobs_errtable.global*, and *rtma/new_rtma_nam_errtable.r3dv* in the ./fix directory. The *nam_errtable.r3dv* is used in the sample run script as a default observation error table. The observation error file is a text file that can be easily edited to tune the error values. The following shows a portion of *nam_errtable.r3dv* file for rawinsondes and its description of each column in Table 4.10:

```
Column # 1
                   2
 120 OBSERVATION TYPE
 0.11000E+04 0.12696E+01 0.60737E+00 0.10000E+10 0.76322E+00 0.10000E+10
 0.10500E+04 0.13282E+01 0.66294E+00 0.10000E+10 0.76322E+00 0.10000E+10
 0.10000E+04 0.13932E+01 0.74223E+00 0.10000E+10 0.76322E+00 0.10000E+10
 0.95000E+03 0.14390E+01 0.83688E+00 0.10000E+10 0.79899E+00 0.10000E+10
 0.90000E+03 0.14354E+01 0.94025E+00 0.10000E+10 0.83561E+00 0.10000E+10
 0.85000E+03 0.13669E+01 0.10439E+01 0.10000E+10 0.87224E+00 0.10000E+10
 220 OBSERVATION TYPE

 0.90000E+03 0.10000E+10 0.10000E+10 0.24934E+01 0.10000E+10 0.10000E+10
 0.85000E+03 0.10000E+10 0.10000E+10 0.25155E+01 0.10000E+10 0.10000E+10
```

Table 4.10: Description of each column in the observation error table file

Column #	1	2	3	4	5	6
Content	Pressure	T	RH	UV	Ps	Pw
Unit	hPa	degree C	percent/10	m/s	mb	kg/m2(or mm)

For each observation type, the error table has six columns and 33 rows (levels). The 1st column prescribes 33 pressure levels, covering 1100 hPa to 0 hPa. Columns 2-6 prescribe

observation errors for temperature (T), relative humidity (RH), horizontal wind component (UV), surface pressure (Ps), and the total column precipitable water (Pw). The missing value is 0.10000E+10.

The observation error table for each observation type starts with the observation type number defined for the PrepBUFR files, such as:

```
120 OBSERVATION TYPE
220 OBSERVATION TYPE
```

The PrepBUFR data type numbers 100-199 are for temperature (T), moisture (q), and surface pressure (Ps) observations, while numbers 200-299 are for horizontal wind component (UV) observations. A detailed explanation of each data type number can be found in the following table on the EMC website:

```
http://www.emc.ncep.noaa.gov/mmb/data_processing/prepbufr.doc/table_2.htm
```

For more details on PrepBUFR/BUFR, please check the BUFR/PrepBUFR User's Guide, which is freely available at the DTC BUFR/PrepBUFR website:

```
http://www.dtcenter.org/com-GSI/BUFR/index.php
```

4.7.2 Observation Error Gross Error Check within GSI

The gross error check is an important quality control step to exclude questionable observations that degrade the analysis. Users can adjust the threshold of the gross error check for each data type within the *convinfo* file to make the gross error check more or less strict for a certain data type. For example, the following is a part of the *convinfo* file without the last five columns:

```
type
          sub iuse twindow numgrp ngroup nmiter gross ermax ermin var_b
                                                                  var_pg ithin
                    3.0 0 0 4.0 3.0 1.0 4.0 0.000300
ps
       183
           0 -1
               1
       187
             0
                      3.0
                              0
                                    0
                                         0 4.0
                                                  3.0
                                                       1.0
                                                           4.0 0.000300
                                                                            0
       120
             0
                 1
                      3.0
                              0
                                   0
                                         0
                                            8.0
                                                  5.6
                                                       1.3
                                                            8.0 0.000001
                                                                            0
t
       126
                -1
                                                            8.0 0.001000
                      3.0
                                            8.0
```

The gross check for each data type is controlled by columns "gross", "ermax", and "ermin." If an observation has observation error set to "obserror," then a gross check ratio is calculated:

```
ratio = (Observation-Background)/max(ermin,min(ermax,obserror))
```

If *ratio* > *gross*, then this observation fails the gross check and will not be used in the analysis. The unused observation is indicated as a "rejection" in the fit files.

4.8 Background Error Covariance

The GSI package has several files in ./fix to hold the pre-computed background error statistics for different GSI applications with different grid configurations. Within the ./fix subdirectories ./fix/Big_Endian and ./fix/Little_Endian contain the fix files corresponding to each endianness. Since the GSI code has a build-in mechanism to interpolate the input background error matrix to any desired analysis grid, the following two background error files can be used to specify the B matrix for any GSI regional application.

- nam_nmmstat_na.gcv: contains the regional background error statistics, computed using forecasts from the NCEP's NAM model covering North America. The values of this B matrix cover the northern hemisphere with 93 latitude lines, from -2.5 degrees to 89.5 degrees with 60 vertical sigma levels from 0.9975289 to 0.01364.
- nam_glb_berror.f77.gcv: contains the global background errors based on NCEP's GFS model, a global forecast model. The values of this B matrix cover the globe with 192 latitude lines from -90 degrees to 90 degrees and 42 vertical sigma levels from 0.99597 to 0.013831.

The background error matrix files listed above are in Big Endian binary form (therefore located in the <code>Big_Endian</code> directory). In the <code>Little_Endian</code> directory, <code>nam_nmmstat_na.gcv</code> and <code>nam_glb_berror.f77.gcv</code> are their Little Endian versions for certain computer platforms that cannot compile GSI with the Big Endian option. In this release version, GSI can be compiled with the Big Endian option with PGI and Intel.

4.8.1 Tuning Background Error Covariance through the Namelist and Anavinfo File

The final background error covariance matrix used in the GSI analysis is the content from the fixed file "berror", which is a copy of $nam_nmmstat_na.gcv$ or $nam_glb_berror.f77.gcv$, multiplied by several factors set by the namelist and the **anavinfo** file.

In GSI namelist, three variables are used for tuning horizontal and vertical impact scales:

- vs scale factor for vertical correlation lengths for background error
- hzscl(3) scale factor for three scales specified for horizontal smoothing
- hswgt(3) weights to apply to each horizontal scales

In the GSI anavinfo file, the column **as/tsfc_sdv** in the *control_vector* section are factors for tuning the variance of each analysis control variable.

These values can be used to tune the background error covariance used in the GSI analysis. For each background error matrix file, there are recommended values for these parameters listed in table 4.11.

Table 4.11: Recommended tuning values for the provided B matrix.

	Global		Regiona	al
fixed B ma-	nam_gll	o_berror.f77.gcv	nam_nn	nmstat_na.gcv
trix				
vs	0.7		1.0	
hzscl	1.7, 0.8,	0.5	0.373,0.	746,1.50
hswgt	0.45, 0.3	3,0.25	0.45, 0.	3,0.25
ss/tsfc_sdv				
	contro	l_vector::	contro	l_vector::
	!var	as/tsfc_sdv	!var	as/tsfc_sdv
	sf	0.60	sf	1.00
	vp	0.60	vp	1.00
	ps	0.75	ps	0.50
	t	0.75	t	0.70
	q	0.75	q	0.70
	oz	0.75	oz	0.50
	sst	1.00	sst	1.00
	CW	1.00	CW	1.00
	stl	3.00	stl	1.00
	sti	3.00	sti	1.00

4.9 Analysis Increments

Analysis increments are defined as the difference between analysis results and the background (A-B). A plot of analysis increments can help users understand how the analysis procedure modifies the background fields according to observations, background and observation error covariances, and other constraints. You can either calculate *analysis-guess* and plot the difference field or use the tools introduced in Appendix A.4 to make analysis increment figures for different analysis fields.

4.10 Running Time and Memory Usage

In addition to analysis increments, run time and memory usage are other important features of an analysis system, especially for operational code like the GSI.

The GSI standard output file (*stdout*) gives the GSI start time and end time of the analysis at the beginning and end of the file. For example:

. .

This tells us the analysis started at 20:36:21.760 and ended at 20:43:40.422, which means GSI used 7 minutes and 19 seconds to finish.

Following the ending date-time, there is a resource statistics section at the end of the *stdout* file, which gives information about run time and memory usage for the analysis:

**************************************	******
The total amount of wall time	= 438.663534
The total amount of time in user mode	= 427.578998
The total amount of time in sys mode	= 9.457562
The maximum resident set size (KB)	= 2020132
Number of page faults without I/O activity	= 312762
Number of page faults with I/O activity	= 0
Number of times filesystem performed INPUT	= 0
Number of times filesystem performed OUTPUT	= 0
Number of Voluntary Context Switches	= 7641
Number of InVoluntary Context Switches	= 851
**************************************	******

5

GSI Applications

In this chapter, information from the previous chapters will be applied to the regional GSI cases with different data sources and assimilation methods, as well as the global and chemical analysis. These examples are to give users a clear idea of how to set up GSI with various configurations and properly check the run status and analysis results in order to determine if a particular GSI application was successful. Note that the regional examples here only use the WRF-ARW system - WRF-NMM runs are similar, but require different background and namelist options.

For illustrations of all the cases, it is assumed that the reader has successfully compiled GSI on a local machine.

For regional WRF-ARW case studies, users should have the following data available:

- 1. Background file
 - When using WRF, WPS and real.exe will be run to create a WRF input file: wrfinput_<domain>
 - Users can also use the forecast files from running WRF: wrfout_<domain>_<yyyy-mm-dd_hh:mm:ss>. In this chapter, WRF forecast files are being used as the background files.
- 2. Conventional data
 - Real time RAP PrepBUFR data can be obtained from the server:

 ftp://ftpprd.ncep.noaa.gov/pub/data/nccf/com/rap/prod

 Note: A RAP PrepBUFR file, prepared by the NCEP and used by the NOAA Rapid
 Refresh (RAP) and High Resolution Rapid Refresh (HRRR), was chosen to increase
 the amount of data used in the analysis (compared to a GDAS PrepBUFR file)
- 3. Radiance data and GPS RO data
 - Real time GDAS BUFR files can be obtained from the following server:

ftp://ftpprd.ncep.noaa.gov/pub/data/nccf/com/gfs/prod

Note: GDAS data was chosen to get better coverage for radiance and GPS Radio
Occultation (RO).

The background and observation files for the global and chemical analysis will be introduced in the later sections.

The following cases will give users an example of a successful GSI run with various data sources. Users are welcome to download these example data from the GSI users' webpage (online case) or create a new background and get the observational data from the above servers.

The background and observations used in the regional WRF-ARW cases are as follows:

- 1. Background files: wrfout_d01_2018-08-12_12:00:00
 - The horizontal grid spacing is 45-km with 33 vertical sigma levels

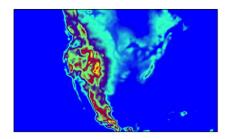

Figure 5.1: The terrain (left) and land mask (right) of the background used in this case study.

- 2. Conventional data: RAP PrepBUFR data from 12 UTC 12 August 2018
 - File: rap.t12z.prepbufr.tm00
- 3. Radiance and GPS RO data: GDAS BUFR data from 12 UTC 12 August 2018
 - Files: gdas1.t12z.1bamua.tm00.bufr_d gdas1.t12z.1bhrs4.tm00.bufr_d gdas1.t12z.1bmhs.tm00.bufr_d gdas1.t12z.gpsro.tm00.bufr_d

This case study was run on a Linux cluster. As of version 3.2, the BUFR/PrepBUFR files do not need to be byte-swapped to little endian format. BUFRLIB can automatically handle byte order issues.

Assume the background file is located at:

casedata/2018081212/bkg

All the observations are located at:

casedata/2018081212/obs

And the GSI release version is located at:

code/comGSI(version_number) EnKF(version_number)

5.1 Assimilating Conventional Observations with Regional GSI

5.1.1 Run Script

With GSI successfully compiled and background and observational data acquired, move to the ./ush directory under ./comGSIv3.7_EnKFv1.3 to run the GSI using the sample script comgsi_run_regional.ksh. The comgsi_run_regional.ksh script must be modified in several places before running:

• Set up batch queuing system.

To run GSI with multi-processors, a job queuing section has to be added at the beginning of the *comgsi_run_regional.ksh* script. The set up of the job queue depends on the machine and the job control system. More setup examples are described in section 3.2.2. The following example is set up to run on a Linux cluster supercomputer with PBS. The job section is as follows:

```
#PBS -A ??????
#PBS -1 walltime=00:20:00
#PBS -N cg02-case03-conv
#PBS -1 select=1:ncpus=4:mpiprocs=4
#PBS -q premium
#PBS -o out.case03-conv
#PBS -j oe
```

In order to find out how to set up the job section, a good start is to use an existing MPI job script and copy the job section over.

• Set up the number of processors and the job queue system used. For this example, LINUX PBS and four processors are used:

```
GSIPROC=4
ARCH='LINUX_PBS'
```

Set up the case data, analysis time, GSI fix files, GSI executable, and CRTM coefficients:

Set up analysis time:

```
ANAL_TIME=2018081212
```

Set up a working directory, which will hold all the analysis results. This directory must have correct write permissions, as well as enough space to hold the output.

```
JOB_DIR=the_job_directory
#normally you put run scripts here and submit jobs form here, require a copy of gsi.x at this directory
RUN_NAME=a_descriptive_run_name_such_as_case05_3denvar_etc
```

Set path to the background directory and file:

```
BK_R00T=casedata/2018081212/bkg
BK_FILE=${BK_R00T}/wrfout_d01_2018-08-12_12:00:00
```

Set path to the observation directory and the PrepBUFR file within the observation directory. All observations to be assimilated should be in the observation directory.

```
OBS_ROOT=casedata/2018081212/obs
PREPBUFR=${OBS_ROOT}/rap.t${HH}z.prepbufr.tm00
```

Set up the GSI system used for this case, including the paths of fix files and the CRTM coefficients as well as the location of the GSI executable and the namelist file. Please be sure to modify accordingly.

```
GSI_ROOT=the_comgsi_main directory where src/ ush/ fix/ etc are located
CRTM_ROOT=the_CRTM_directory
ENS_ROOT=the_directory_where_ensemble_backgrounds_are_located
    #ENS_ROOT is not required if not running hybrid EnVAR
HH='echo $ANAL_TIME | cut -c9-10'
GSI_EXE=${JOB_DIR}/gsi.x #assume you have a copy of gsi.x here
WORK_ROOT=${JOB_DIR}/${RUN_NAME}}
FIX_ROOT=${GSI_ROOT}/fix
GSI_NAMELIST=${GSI_ROOT}/ush/comgsi_namelist.sh
```

• Set which background and background error file to use:

```
bk_core=ARW
bkcv_option=NAM
if clean=clean
```

This example uses the ARW NetCDF background; therefore bk_core is set to 'ARW'. The regional background error covariance file is used in this case, as set by bkcv_option=NAM. Finally, the run scripts is set to clean the run directory to delete all temporary intermediate files.

5.1.2 Run GSI and Check the Run Status

Once the run script is set up properly for the case and machine, GSI can be run through the run script. On our test machine, the GSI run is submitted as follows:

```
$ qsub comgsi_run_regional.ksh
```

Next, move to the working directory and check the details. While GSI is running, the contents of this directory should include files such as:

```
imgr_g12.TauCoeff.bin ssmi_f15.SpcCoeff.bin imgr_g13.SpcCoeff.bin ssmi_f15.TauCoeff.bin imgr_g13.TauCoeff.bin ssmis_f16.SpcCoeff.bin
```

These are CRTM coefficient files that have been linked to this run directory through the GSI run script. Additionally, many other files are linked or copied to this run directory or generated during the run, such as:

- stdout: standard output file
- wrf_inout: background file
- gsiparm.anl: GSI namelist
- prepbufr: prepBUFR file for conventional observation
- convinfo: data usage control for conventional data
- berror_stats: background error file
- errtable: observation error file

The presence of these files indicates that the GSI run scripts have successfully set up a run environment for GSI and that the GSI executable is running. While GSI is still running, checking the content of the standard output file (*stdout*) can monitor the status of the GSI analysis:

```
$ tail stdout
 cost,grad,step,b,step? =
                                                                                               1 17 1.377774626348101629E+04 7.451202547871611515E+00 4.626071752079010935E+01 6.438326819051856109E-01
 cost,grad,step,b,step? =
                                                                                                 1 18 1.377517784904208384E+04
                                                                                                                                                                                                                         5.686038514327907301E+00 4.998548357396024500E+01

```

The above output shows that GSI is in the inner iteration stage. It may take several minutes to finish the GSI run. Once GSI has finished running, the number of files in the directory will be greatly reduced from those during the run stage. This is because the run script was set to clean the working directory after a successful run. The important analysis result files and configuration files will remain. Please check Section 3.3 for more details on GSI run results. Upon successful completion of GSI, the run directory will look as follows:

```

5.1.3 Check for Successful GSI Completion

It is important to always check for a successful completion of the GSI analysis. However, completion of the GSI run without crashing does not guarantee a successful analysis. First, it is necessary to check the *stdout* file in the run directory to make sure GSI completed each step without any obvious problems. The following are several important steps to check:

1. Read in the anavinfo and namelist files

The following lines show that GSI started normally and has read in the anavinfo and namelist files:

```
gsi_metguess_mod*init_: 2D-MET STATE VARIABLES:
ps
z
gsi_metguess_mod*init_: 3D-MET STATE VARIABLES:
u
v
.....
state_vectors*init_anasv: 2D-STATE VARIABLES ps sst
state_vectors*init_anasv: 3D-STATE VARIABLES u v tv tsen q oz cw prse
```

```
radiance_mode_init: icloud_fwd= F iallsky= F cw_cv= T iaerosol_fwd= F iaerosol= F
radiance_mode_init: n_actual_clouds=
                                            1
radiance_mode_init: cloud_names=cw
GSI_4DVAR: nobs_bins =
                                 3
SETUP_4DVAR: nobs_bins = 3, ntlevs_ens =
                                            1
SETUP_4DVAR: allocate array containing time levels for ensemble
SETUP_4DVAR: timelevel = 1 , ens_fhrlevs =
&SETUP
           78.0000000000000
GENCODE =
           = 0.0000000000000E+000,
FACTQMIN
FACTQMAX
              = 0.0000000000000E+000,
CLIP_SUPERSATURATION
                      = F,
           0.00000000000000
FACTV =
FACTL
           0.00000000000000
FACTP
           0.00000000000000
FACTG =
           0.00000000000000
```

2. Read in the background field

The following lines in standard output file, immediately following the namelist section, indicate that GSI is reading the background fields.

```
CONVERT_NETCDF_MASS: problem with flnm1 = wrf_inou9, Status =
                                                                  -1021
                                                               8
                                                                                                      21360240
READ_wrf_mass_FILES: analysis date,minutes

```

This table is an important step to check if the observations have been read in, which types of observations have been read in. At this point, GSI has read in all the data needed for the analysis.

4. Inner iteration

The inner iteration step in the standard output file will look like this:

```
Begin J table inner/outer loop 0 1
Surface pressure 4.7741393535600264E+03
temperature 7.8419025904486407E+03

```

At the 37th iteration in the second outer loop, GSI met the stop threshold before getting to the maximum iteration number (50). As a quick check, the J value should descend with each iteration. Here, J has a value of 2.525269018893014800E+04 at the beginning and a value of 1.363468612208463492E+04 for the final iteration. Therefore, the value has reduced by about one half, which is an expected reduction.

5. Write out analysis results

The final step of the GSI analysis procedure is to write out the Mean, Min and Max values of the analysis fields and the increments:

```
Status Var
                     Mean

6. As an indication that GSI has successfully run, several lines will appear at the bottom of the file:

After carefully investigating each portion of the standard output file, it can be concluded that GSI successfully ran through every step and there were no run issues. A more complete description of the standard output file can be found in Section 4.1. However, it cannot be concluded that GSI successfully produced an analysis until more diagnosis has been completed.

5.1.4 Diagnose GSI Analysis Results

a Check Analysis Fit to Observations

The analysis uses observations to correct the background fields to fit to the observations under certain constraints. The easiest way to confirm the GSI analysis results fit the observations better than the background is to check a set of files with names *fort.2??*, where ?? is a number from 01 to 19 or larger than 20. In the run script, several "fort" files have also been renamed as *fit_t1* (*q1*, *p1*, *rad1*, *w1*). *YYYYMMDDHH*. Please check Section 4.5.1 for a detailed explanation of the fit files. Here, we illustrate how to use these fit files.

• fit_t1.2018081212 (fort.203)

This file shows how the background and analysis fields fit to temperature observations. The contents of this file show three data types were assimilated in the analysis: 120, 130, and 180. Also included are the number of observations, bias, and RMS errors of observation minus background (o-g 01) or analysis (o-g 03) on each level for the three data types. The following is part of the file:

For example, data type 120 has 1169 observations in layer 400.0-600.0 hPa, a bias of 0.49, and a RMS error of 1.05. The last column shows the statistics for the whole atmosphere. There are several summary lines for all data types, which is indicated by "asm all" in the data types column. For summary O-B (which is "o-g 01" in the file), there are 7085 observations in total, for a bias of 0.61, and a RMS error of 1.75.

Skipping ahead in the "fort.203" file, "o-g 03" columns (under "it") show the observation minus analysis (O-A) information. Under the summary ("all") rows, it can be seen that there were 7085 total observations, a bias of 0.23, and a RMS error of 1.16. This shows that from the background to the analysis, the bias reduced from 0.61 to 0.23, and the RMS error reduced from 1.75 to 1.16. This is about a 62% and 34% reduction respectively, which is a good reduction for the regional analysis.

• fit_w1.2018081212 (fort.202)

This file demonstrates how the background and analysis fields fit to wind observations. This file is formatted the same way as *fort.203*. Therefore, only the summary lines for O-B and O-A will be shown here to gain a quick view of the fit to observations:

current vi	fit of wind data, r	anges i	n m/s											
o-g		ptop	1000.0	900.0	800.0	600.0	400.0	300.0	250.0	200.0	150.0	100.0	50.0	0.0

o-g 01	asm all	count	497	238	227	262	186	447	373	492	677	757	0	4156
o-g 01	asm all	bias	7.48	7.40	4.43	1.80	-0.26	-0.36	-1.76	-5.06	-7.64	-9.35	0.00	-2.08
o-g 01	asm all	rms	11.76	12.18	10.32	12.09	14.13	12.47	14.90	18.43	22.84	24.35	0.00	17.86
o-g 03	asm all	count	497	238	227	262	186	447	373	492	677	757	0	4156
o-g 03	asm all	bias	1.29	0.81	1.13	0.37	0.33	-0.06	-0.41	-1.50	-2.99	-6.36	0.00	-1.57
o-g 03	asm all	rms	5.98	5.14	4.81	7.98	9.41	8.66	10.83	13.50	17.19	19.94	0.00	13.26

O-B: 4156 observations in total, bias is -2.08, and RMS error is 17.86 O-A: 4156 observations in total, bias is -1.57, and RMS error is 13.26 The total bias and RMS error were both largely reduced.

• fit_p1.2018081212 (fort.201)

This file demonstrates how the background and analysis fields fit to surface pressure observations. Because surface pressure is a two-dimensional field, the table is formatted differently than the three-dimensional fields shown above. Once again, only the summary lines will be shown for O-B and O-A to gain a quick view of the fit to observations:

o-g it	obs use typ styp	count	bias	rms	cpen	qcpen
o-g 01	asm all	6251	-0.2037	0.7633	0.7637	0.7637
o-g 03	asm all	6251	0.0150	0.5376	0.3596	0.3596

O-B: 6251 observations in total, bias is -0.2037, and RMS error is 0.7633 O-A: 6251 observations in total, bias is 0.0150, and RMS error is 0.5376

Both the total bias and RMS error were reduced.

These statistics show that the analysis results fit to the observations closer than the background, which is what we would expect. How close the analysis fits to the observations is based on the ratio of background error covariance and observation error.

b Check the Minimization

In addition to the minimization information in the standard output file, GSI writes more detailed information into a file called "fort.220." The content of "fort.220" is explained in the Advanced GSI User's Guide. Below is an example of a quick check of the cost function trend and the norm of gradient. The values should get smaller with each iteration.

In the run directory, information on the cost function and norm of the gradient can be dumped into an output file by using the following command:

```
$ grep 'cost,grad,step,b' fort.220 | sed -e 's/cost,grad,step,b,step? = //g' | sed -e 's/good//g' > cost_gradient.txt
```

The output file *cost_gradient.txt* includes six columns, however only the first four columns are needed and are explained below. The first and last five lines are:

```
1 2.218140169269516628E+04 3.212948564609200730E+02 2.133681787464458424E+01
                                                                    6.649407734248591328E-01
  2 1.997879377333894445E+04 2.485530349560721959E+02 4.318845368915710736E+01 5.984537528616304947E-01
   3 1.731067108515735890E+04
                          1.990853912639774137E+02
                                               2.912427563070909997E+01
                                                                    6.415649729561008208E-01
   4 1.615633062397510366E+04 1.865345902820838262E+02 2.809840761991527103E+01
                                                                    8.778897313990374762E-01
2 33 1.363468612787015809E+04
                          9.544428453907339432E-03 2.494860880527297908E+01 1.064566883607217962E+00
2 34 1.363468612559743997E+04 6.120955749102529111E-03 4.469155955050479889E+01 4.112810488623842020E-01
2\ \ 35\ \ 1.363468612392302020E+04\ \ 5.111121533712363954E-03\ \ 3.663810108770889684E+01\ \ 6.972573690510027733E-01
2\ \ 36\ \ 1.363468612296590072E + 04\ \ 5.549509485982077710E - 03\ \ 2.861531574243975129E + 01\ \ 1.178899912735292821E + 00
```

The first column is the outer loop number and the second column is the inner iteration number. The third column is the cost function, and the forth column is the norm of the gradient. It can be seen that both the cost function and norm of the gradient are descending.

To get a complete picture of the minimization process, the cost function and norm of the gradient can be plotted using an included NCL script located here:

./util/Analysis_Utilities/plot_ncl/GSI_cost_gradient.ncl

The plot is shown as Fig.5.2:

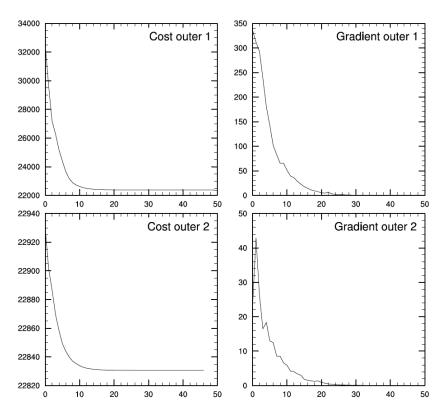

Figure 5.2: The cost function (y-axes) and norm of the gradient (y-axes) change with each iteration (x-axes).

The above plots demonstrate that both the cost function and norm of the gradient descend very fast in the first ten iterations in both outer loops and drop very slowly afterward.

c Check the Analysis Increment

The analysis increment gives us an idea of where and how much the background fields have been modified by the observations through the analysis. Another useful graphics tool that can be used to look at the analysis increment is located here:

 $./util/Analysis_Utilities/plot_ncl/Analysis_increment.ncl\\$

The graphic below shows the analysis increment at the 2nd vertical level on the analysis grid. Notice that the scales are different for each of the plots.

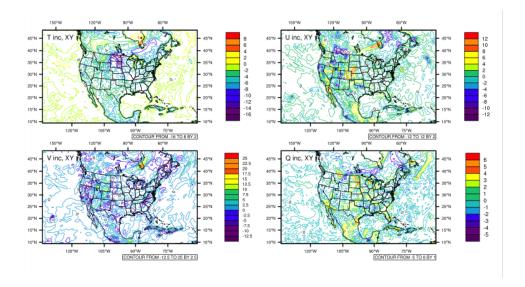

Figure 5.3: Analysis increment at the 2nd level

The analysis increment indicates that conventional observations are mostly located within the continental United States and that data availability over the ocean is very sparse.

5.2 Assimilating Radiance and GPS RO data with Regional GSI

5.2.1 Run Script

Adding radiance and GPS RO data into the GSI analysis is straightforward after having already run GSI with conventional data. The same run script from the above section can be used to run GSI with radiance and GPS RO data (with or without PrepBUFR data). The key step to adding the data is linking the radiance and GPS RO BUFR files to the GSI run directory with the names listed in the &OBS_INPUT section of the GSI namelist. The following example adds three radiance BUFR files and the GPS RO file:

AMSU-A: gdas1.t12z.1bamua.tm00.bufr_d HIRS4: gdas1.t12z.1bhrs4.tm00.bufr_d MHS: gdas1.t12z.1bmhs.tm00.bufr_d GPS RO: gdas1.t12z.gpsro.tm00.bufr_d

Please make sure these BUFR files are located as included in the variable OBS_ROOT and link them to the work directory in the script <code>comgsi_run_regional.ksh</code>:

```
# Link to the radiance data
srcobsfile[1]=${OBS_ROOT}/gdas1.t${HH}z.satwnd.tm00.bufr_d
gsiobsfile[1]=satwnd
srcobsfile[2]=${OBS_ROOT}/gdas1.t${HH}z.1bamua.tm00.bufr_d
gsiobsfile[2]=amsuabufr
```

```
srcobsfile[3]=${OBS_ROOT}/gdas1.t${HH}z.1bhrs4.tm00.bufr_d
gsiobsfile[3]=hirs4bufr
srcobsfile[4]=${OBS_ROOT}/gdas1.t${HH}z.1bmhs.tm00.bufr_d
...
ii=1
while [[ $ii -le 21 ]]; do
    if [ -r "${srcobsfile[$ii]}" ]; then
        ln -s ${srcobsfile[$ii]} ${gsiobsfile[$ii]}"
        echo "link source obs file ${srcobsfile[$ii]}"
    fi
    (( ii = $ii + 1 ))
done
```

If radiance and RO data are desired in addition to conventional prepBUFR data, the following link to the PrepBUFR data should be kept as is:

```
ln -s ${PREPBUFR} ./prepbufr
```

Alternatively, to analyze radiance and RO data without conventional PrepBUFR data, this line can be commented out in the script *comgsi_run_regional.ksh*:

```
# ln -s ${PREPBUFR} ./prepbufr
```

In the following example, conventional observations will be assimilated, in addition to the radiance and GPS RO.

In order to link the correct name for the radiance BUFR file, the namelist section &OBS_INPUT should be referenced. This section has a list of data types and BUFR file names that can be used in GSI. The 1st column "dfile" is the file name recognized by GSI. The 2nd column "dtype" and 3rd column "dplat" are the data type and data platform that are included in the file listed in "dfile," respectively. For example, the following lines tell us the AMSU-A observation from NOAA-15 should be read from a BUFR file named "amsuabufr", and the GPS RO refractivity observations "gps_ref" should be read from a BUFR file named "gpsrobufr":

```
! dfile dtype dplat dsis dval dthin dsfcalc
amsuabufr amsua n15 amsua_n15 10.0 2 0
gpsrobufr gps_ref null gps 1.0 0
```

With radiance data assimilation, data thinning and bias correction need to be checked carefully. The following is a brief description of these two:

Radiance data thinning
 Radiance data thinning is found in the namelist section

Radiance data thinning is found in the namelist section &OBS_INPUT. The following is a part of namelist in that section:

The first line of &OBS_INPUT lists multiple mesh grids as elements of the array dmesh (three mesh grids in the above example). For the line specifying data type, the 2nd to last element of that line is used to specify the choice of dthin. This selects the mesh grid to be used for thinning. The data thinning option for NOAA-15 AMSU-A observations is set to 60 km because the value of dthin is two, corresponding to dmesh(2)=60 km. For more information about radiance data thinning, please refer to the Advanced GSI User's Guide.

• Radiance data bias correction

Radiance data bias correction is very important for successful radiance data assimilation. In the sample run scripts, there are two files related to bias correction:

```
# for satellite bias correction
# Users may need to use their own satbias files for correct bias correction
cp ${GSI_ROOT}/fix/comgsi_satbias_in ./satbias_in
cp ${GSI_ROOT}/fix/comgsi_satbias_pc_in ./satbias_pc_in
```

For this case, the GDAS bias correction files were downloaded and saved in the fix directory as examples. For other cases, the run script should link to corresponding bias correction coefficient files. The first line sets the path to the bias coefficient file, and the second copies the bias correction coefficients for passive (monitored) channels into the working directory. These two coefficient files are usually calculated from within GSI in the previous cycle. Two files are provided in ./fix as examples of the bias correction coefficients. For the best results, it is necessary for the user to generate his or her own bias files. The details of radiance data bias correction are discussed in the Advanced GSI User's Guide. Please note that GSI releases prior to v3.5 have coefficients for mass bias correction and angle bias correction calculated separately.

Once these links are set, we are ready to run GSI.

5.2.2 Run GSI and Check Run Status

The process for running GSI is the same as described in section 5.1.2. Once comgsi_run_regional.ksh has been submitted, move into the run directory to check the GSI analysis results. For the current case, the run directory will look almost as it did for the conventional data case, the exception being the links to the radiance and GPS RO BUFR files and new diag files for the radiance data types used. Following the same steps as in section 5.1.2, check the stdout file to see if GSI has run through each part of the analysis process successfully. In addition to the information outlined for the conventional run, the radiance BUFR files should have been read in, as well as the refractivity data from GPS RO:

```

When comparing this output to the content in step three of section 5.1.3, it can be seen that, in addition to the GPS refractivity observations (gps_ref), there are twelve new radiance data types that have been read in: HIRS4 from METOP-A, METOP-B and NOAA-19, AMSU-A from NOAA-15, NOAA-18, NOAA-19, METOP-A, and METOP-B, and MHS from NOAA-18, NOAA-19, METOP-A, and METOP-B.

5.2.3 Diagnose GSI Analysis Results

a Check Analysis Fit to Observations

The file *fort.207* contains the statistics for the radiance data, similar to file *fort.203* for temperature. This file contains important details about the radiance data analysis. Section 4.5.2 explains this file in detail. Below are some values from the file *fort.207* to provide a quick look at the radiance assimilation for this example.

The fort.207 file contains the following lines:

For O-B, before the first outer loop:

it	satellite instrument	# read	# keep	# assi	im penalty	qcpnlty	cpen	qccpen
o-g 01 rad	n15 amsua	32535	22797	3193	3593.4	3593.4	1.1254	1.1254
o-g 01 rad	n18 amsua	33465	27762	9127	2973.1	2973.1	0.32575	0.32575

For O-A, after the second outer loop:

o-g 03 rad	n15	amsua	32535	22797	6006	2020.2	2020.2	0.33636	0.33636
o-g 03 rad	n18	amsua	33465	27762	10483	1386.9	1386.9	0.13230	0.13230

From the above information, it can be seen that AMSU-A data from NOAA-15 provides 32535 observations within the analysis time window and domain. After thinning, 22797 observations remained, and only 3193 passed the quality check and were used in the analysis. The penalty for this data decreased from 3593.4 to 2020.2 after two outer loops. It is important to note that the number of AMSU-A observations assimilated in the O-A calculation increased to 6006 from 3193 as more data passed the quality check in the $2^{\rm nd}$ outer loop.

The statistics for each channel can be viewed in the *fort.207* file as well. Here, channels from AMSU-A NOAA-15 are listed as an example:

For O-B, before the first outer loop:

1	1 amsua_n15	190	0	3.000	2.9421171	0.4438706	0.1561571	1.5278684	1.4619715
2	2 amsua_n15	190	0	2.200	0.8933773	0.0750037	0.1639086	1.3984509	1.3964381
3	3 amsua_n15	190	0	2.000	1.2106089	-0.0473438	0.1661452	1.0258870	1.0247940
4	4 amsua_n15	190	0	0.600	-0.4461829	-0.5369729	0.7065383	0.6161111	0.3020812
5	5 amsua_n15	190	0	0.300	-0.0791235	-0.0665128	0.3446176	0.2013947	0.1900944
6	6 amsua_n15	292	342	-0.230	-2.4084362	0.5222298	4.1440417	0.5364275	0.1225986
7	7 amsua_n15	1320	435	0.250	0.0772148	0.2545220	1.1522083	0.3141868	0.1842060
8	8 amsua_n15	733	1022	0.275	0.2375745	0.4957631	2.3953990	0.5205394	0.1586827
15	15 amsua n15	190	0	3.500	0.3668241	0.3548074	0.1291879	1.4624421	1.4187490

For O-A, after the second outer loop:

1	1 amsua_n15	361	0	3.000	2.3526577	-0.0691773	0.0570915	0.9734396	0.9709784
2	2 amsua_n15	361	0	2.200	1.0975100	0.2032144	0.0916095	1.0612608	1.0416229
3	3 amsua_n15	361	0	2.000	1.4728299	0.1679623	0.0870602	0.7443155	0.7251168
4	4 amsua_n15	361	0	0.600	-0.2468814	-0.3416600	0.3559445	0.4243844	0.2517351
5	5 amsua_n15	361	0	0.300	0.0601439	0.0652633	0.2859038	0.1824454	0.1703732
6	6 amsua_n15	571	289	-0.230	-2.4451832	0.4898659	3.7588334	0.5051936	0.1234989
7	7 amsua_n15	1560	195	0.250	-0.1917289	0.0354134	0.4463849	0.1931275	0.1898529
8	8 amsua_n15	1512	243	0.275	-0.1662265	0.0570724	0.3423785	0.1943532	0.1857846
9	9 amsua_n15	768	987	0.340	0.1799446	0.3241856	0.6087271	0.3750867	0.1886630
15	15 amsua_n15	361	0	3.500	0.3218240	0.4970433	0.0604030	1.0051883	0.8736998

The second column is the channel number for AMSU-A and the last column is the standard deviation for each channel. It can be seen that most of the channels fit better to the observations after the second outer loop.

The file *fort.212* shows the fit of the analysis/background to the GPS RO data as fractional differences. It has the same structure as the fit files for conventional data. Below is a quick look to be sure the GPS RO data were used:

Observat	tion - Background ((O-B)												
current fit of gps data in fractional difference														
o-g		ptop	1000.0	900.0	800.0	600.0	400.0	300.0	250.0	200.0	150.0	100.0	50.0	0.0
o-g it	obs use typ styp	pbot	1200.0	1000.0	900.0	800.0	600.0	400.0	300.0	250.0	200.0	150.0	100.0	2000.0
o-g 01	asm all	count	0	0	1	33	85	79	47	49	62	89	108	553
o-g 01	asm all	bias	0.00	0.00	0.35	0.33	-0.57	-0.22	-0.22	-0.05	-0.34	0.10	0.31	-0.08
o-g 01	asm all	rms	0.00	0.00	0.35	1.12	1.32	0.57	0.51	0.73	0.78	0.39	0.67	0.80
Observat	tion - Analysis (O-	A)												
		ptop	1000.0	900.0	800.0	600.0	400.0	300.0	250.0	200.0	150.0	100.0	50.0	0.0
it	obs type styp	pbot	1200.0	1000.0	900.0	800.0	600.0	400.0	300.0	250.0	200.0	150.0	100.0	2000.0
o-g 03	asm all	count	0	0	1	33	85	80	50	55	66	88	110	568
o-g 03	asm all	bias	0.00	0.00	0.07	0.28	0.03	-0.06	-0.08	0.09	-0.10	0.01	0.05	0.01
o-g 03	asm all	rms	0.00	0.00	0.07	0.77	0.50	0.30	0.24	0.32	0.36	0.23	0.28	0.37

It can be seen that most of the GPS RO data are located in the upper levels, with a total of 553 observations used in the analysis during the 1st outer loop, and 568 used to calculate O-A. After the analysis, the data bias reduced from -0.08 to 0.01, and the RMS error was reduced from 0.80 to 0.37. It can be concluded that the analysis with GPS RO data looks reasonable from these statistics.

b Check the Analysis Increment

The same methods for checking the optimal minimization as demonstrated in section 5.1.4.2 can be used for this case. Similar features to the conventional assimilation should be seen with the minimization. The figures below show detailed information on how the radiance and GPS RO data impact the analysis results on top of the conventional data. Using the same NCL script as in section 5.1.4.3, analysis increment fields are plotted comparing the analysis results with radiance, GPS RO and conventional data, to the analysis results with conventional data assimilation only. Figure 5.5 is for vertical level 21 and Figure 5.4 is for vertical level 2, respectively.

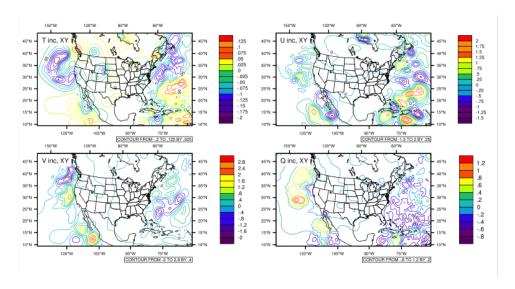

Figure 5.4: Analysis increment fields of the PrepBUFR, GPS RO and radiance data analysis compared to the analysis with prepBUFR only at vertical level 2

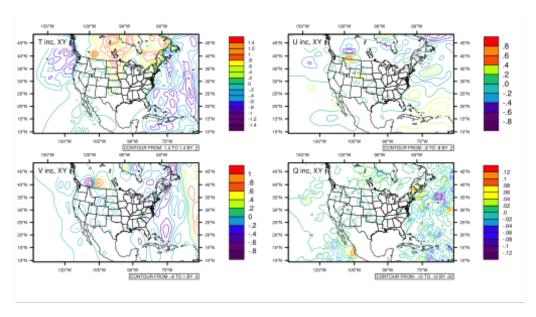

Figure 5.5: Analysis increment fields of the PrepBUFR, GPS RO and radiance data analysis compared to the analysis with prepBUFR only at vertical level 21

In order to fully understand the analysis results, the following topics should be reviewed:

- 1. The weighting functions of each channel and the data coverage at the analysis time. There are several sources on the internet that show the weighting functions of the AMSU-A channels, as an example. Channel 1 is the moisture channel, while the others are mainly temperature channels (Channels 2, 3, and 15 also have large moisture signals). Because a model top of 50 mb was specified for this case study, the actual impact should come from channels with peak weighting below 50 hPa.
- 2. The usage of each channel is located in the file named 'satinfo' in the run directory. The first two columns show the observation type and platform of the channels, and the third column indicates if the channel is used in the analysis. Because many amsua_n15 and amsua_n18 data were used, they should be checked in detail. In this case, Channels 6, 11, and 14 from amsua_n15 and channels 5, 8, 9 and 14 from amsua_n18 were turned off
- 3. Thinning information, including a quick look at the namelist in the run directory. The file "gsiparm.anl" shows that both amsua_nl5 and amsu_nl8 use thinning grid two, which is 60 km.
- 4. Bias correction: Radiance bias correction was previously discussed. It is very important for a successful radiance data analysis. The run script can only link to the GDAS bias correction coefficients that are provided as an example in ./fix:

```
cp ${GSI_ROOT}/fix/comgsi_satbias_in ./satbias_in
cp ${GSI_ROOT}/fix/comgsi_satbias_pc_in ./satbias_pc_in
```

Users can download the operational bias correction coefficients during their experiment period as a starting point to calculate the coefficients suitable for their experiments.

Radiance bias correction for regional analyses is a difficult issue because of the limited coverage of radiance data. This topic is out of the scope of this document, but this issue should be considered and understood when using GSI with radiance applications.

5.3 GSI Hybrid EnVar Analysis

5.3.1 Introduction to GSI Hybrid 3DEnVar Analysis

The three-dimensional hybrid ensemble-variational (hybrid 3DEnVar) analysis is an important option in the GSI system that has been used operationally. It provides the ability to bring the flow dependent background error covariance into the analysis based on ensemble forecasts. If ensemble forecasts have been generated, setting up GSI to do a hybrid analysis is straightforward and only requires two changes in the run script in addition to the current regional run script comgsi_run_regional.ksh:

• Change 1: Specify the location of the ensemble members

In the run script, point to the directory that contains the ensemble files:

```
ENS_ROOT=case_data/2018081212/gfsens
```

This step is required to link the ensemble members to the GSI run directory and assign each ensemble member a name that GSI recognizes. GSI can accept four kinds of ensemble forecasts, controlled by the namelist variable regional_ensemble_option. Table 5.1 provides a list of options for regional_ensemble_option and the naming convention for linking the ensemble files to GSI recognized names.

regional_	explanation	Function called	GSI recognized ensemble
ensemble_			file names
option			
1	GFS ensemble internally	get_gefs_for_regional	filelist: a text file includ-
	interpolated to hybrid		ing the path and name of
	grid		ensemble files
2	Ensemble is in WRF-	get_wrf_nmm_ensperts	d01_en001,
	NMM (HWRF) format		d01_en002,
			•••
3	Ensemble is in ARW	get_wrf_mass_ensperts_netcdf	wrf_en001,
	netcdf format		wrf_en002,
4	Ensemble is in NMMB	get_nmmb_ensperts	nmmb_ens_mem001,
	format		$nmmb_ens_mem002$,

Table 5.1: List of ensemble forecasts that can be read by GSI

The example script assumes that the hybrid 3DEnVar uses GFS ensemble files. If this is the case, the script will link proper files from the directory ENS_ROOT to the run directory. Please note that starting from this release version, the GFS ensemble has a new format using NEMS IO. If you are using GFS ensemble files like gdas.t{HH}z.atmf006s.mem005.nemsio, please set it up in the run script:

```
if_nemsio=Yes
```

If using non-GFS ensemble files, users have to change the GSI run script to add the links to the ensemble forecasts if they want to use the GSI hybrid function. Below is an example of using an ensemble in ARW netcdf format, assuming that all the ensemble members are located in a directory defined by the parameter \$mempath\$ and the ensemble members have a name such as: $wrfout_d01_\$iiimem$, where \$iiimem is an integer indicating the ensemble member ID. The following lines should be added to the run script with loop iiimem from one to the total number of ensemble members:

```
if [ -r ${mempath}/wrfout_d01_${iiimem} ]; then
    ln -sf ${mempath}/wrfout_d01_${iiimem} ./wrf_en${iiimem}
else
    echo "member ${mempath}/wrfout_d01_${iiimem} does not exit"
fi
```

• Change 2: Set up the namelist options in section HYBRID_ENSEMBLE

In the run script comgsi_run_regional, set it up like this for the hybrid 3DEnVar analyss:

```
if_hybrid=Yes  # Yes, or, No -- case sensitive !
if_4DEnVar=No  # Yes, or, No -- case sensitive (set if_hybrid=Yes first)!
```

Table 5.2: The list of namelist options for GSI hybrid

Options	explanation			
l_hyb_ens	if true, turn on hybrid ensemble option			
uv_hyb_ens	if true, ensemble perturbation wind variables are u and v;			
uv_nyb_cns	otherwise, ensemble perturbation wind variables are stream			
	function and velocity potential			
generate_ens	if true, generate an internal ensemble based on the existing			
generate_ens	background error; recommended = false			
n_ens	number of ensemble members			
beta_s0	value between 0 and 1, default = 1.0			
Deta_so	relative weight given to static background B when			
	(readin_beta=.false.). when (readin_beta=.true.), the verti-			
	cal weighting parameters are read from a file, instead of being			
	defined based on beta_s0 namelist or default value.			
	=1, ensemble information turned off			
	=0, static background errors turned off			
s_ens_h	homogeneous isotropic horizontal ensemble localization scale			
5_015_11	(km)			
s_ens_v	vertical localization scale			
5_6115_v	If positive, in grid units;			
	if negative, in lnp unit			
regional ensemble	integer, used to select the type of ensemble to read in for re-			
_option	gional applications. Currently takes values from one to four:			
_option	=1: use GEFS internally interpolated to ensemble grid;			
	=2: ensembles are in WRF-NMM format;			
	=3: ensembles are in ARW netcdf format;			
	=4: ensembles are in NMMB format.			
grid_ratio_ens	for regional runs, the ratio of ensemble to analysis grid resolu-			
8 4 4 4 4	tion. If turned on and specified with an appropriate value, this			
	could increase the computational efficiency.			
l_ens_in_diff_time	if use ensembles that are available at different time from analysis			
	time.			
	=false: only ensembles available at analysis time can be used			
	for hybrid. (default);			
	=true: ensembles available time can be different from analysis			
	time in hybrid analysis.			
	,			

This will set 1_hyb_ens=.true. to turn on the hybrid ensemble analysis. Commonly used namelist options for the hybrid analysis are listed in table 5.2:

Please note: the parameters s_ens_h, s_ens_v, and beta1_inv are tunable parameters. They should be tuned for best performance.

After setting up the namelist parameters and the path/name of the ensemble members, GSI can be run in the same manner as the other 3DVAR cases introduced in this chapter. The same procedures could be followed as in the previous sections to check the run status and diagnose the GSI analysis.

5.3.2 Introduction to GSI Hybrid 4DEnVar Analysis

The GSI hybrid 4DEnVAR analysis is similar to the hybrid 3DEnVar except that the hybrid 4DEnVar will use multiple background files and GFS ensemble forecasts. As an example, the following shows how to conduct a hybrid 4DEnVar analysis using three time levels of background files and ensembles.

Before creating a hybrid 4DEnVar analysis, be sure to read the previous section about how to run hybrid 3DEnVar first. The following steps are additional procudures beyond hybrid 3DEnVar and assume that all hybrid 3DEnVar settings have already been set.

- (1). Set *if_4DEnVar=Yes* in *comgsi_run_regional.ksh*, in addition to *if_hybrid=Yes*.
- (2). Set the correct background files and ensemble files at different time levels in *comgsi_run_regional.ksh*. See the following example:

```
if [ ${if_4DEnVar} = Yes ] ; then
   BK_FILE_P1=${BK_R00T}/wrfout_d01_${datep1}
   BK_FILE_M1=${BK_R00T}/wrfout_d01_${datem1}

if [ ${if_nemsio} = Yes ]; then
   ENSEMBLE_FILE_mem_p1=${ENS_R00T}/gdas.t${gHH}z.atmf009s.mem
   ENSEMBLE_FILE_mem_m1=${ENS_R00T}/gdas.t${gHH}z.atmf003s.mem
   else
   ENSEMBLE_FILE_mem_p1=${ENS_R00T}/sfg_${gdate}_fhr09s_mem
   ENSEMBLE_FILE_mem_m1=${ENS_R00T}/sfg_${gdate}_fhr03s_mem
   fi
fi
```

Note that the background file at the analysis time (2018081218 for the above example) is set by *BK_FILE* and the ensemble files at the analysis time are set by *ENSEMBLE_FILE_mem* as introduced in previous sections.

Now GSI can be run following the hybrid 3DEnVar case introducted in the prevous section. Similar procedures can be conducted to check the GSI run status and results.

5.4 Introduction to Global GSI analysis

The Global Forecast System (GFS) is a global numerical weather prediction system containing a global computer model and variational analysis run by the U.S. National Weather Service (NWS). As of February 2015, the numerical model is run four times a day, and produces forecasts for up to 16 days in advance, with decreased spatial resolution after 10 days. It is a spectral model with a resolution of T1534 from 0 to 240 hours (0-10 days) and T574 from 240 to 384 hours (10-16 days). In the vertical, the model is divided into 64 layers and temporally, it produces forecast output every hour for the first 12 hours, every 3 hours out to 10 days, and every 12 hours after that. Its data assimilation system runs 6-hourly continuous cycles using the GSI-hybrid.

GSI has many functions specifically designed and tuned for GFS. Although the release version of the community GSI includes all the functions used by the operational systems, the DTC can only support the GSI regional applications because the DTC is not able to run GFS on community computers. Beginning with release version 3.2, the DTC began to introduce the use of GSI for global applications, assuming users can obtain the GFS background through the NCEP data hub or by running GFS themselves.

5.4.1 The Difference between Global and Regional GSI

As mentioned above, all of the NCEP operational systems use GSI as their analysis system. The majority of the GSI code is common to these operational systems. Very little source code is specific to a particular operational system. The main differences in the GSI operational application come from the configuration the run scripts and namelist parameters.

The different GSI applications need different backgrounds, observations, and fixed files. For the GFS system, GSI needs:

- GFS Backgrounds: Typically, GSI uses 6-h GFS forecasts as the background. GFS 3-h and 9-h forecasts are also needed for the FGAT function in the GSI analysis. Both surface and atmosphere forecasts are needed.
- Observations: NCEP has several sets of BUFR/prepBUFR observation files with global coverage for global systems. The files that start with the prefix **GDAS** are for the 6-hourly global data assimilation system. These files have more data available for the analysis, but have a longer delay for use in real-time. The files that start with **gfs** are for the GFS forecasts. Different operational systems need different observation data files because they require different kinds of observations with different coverage, cut-off times, and quality control processes. All these observation files are read in and processed in GSI by the same section of code. Therefore, there is no problem using GFS observation data files for regional GSI applications, as is described in the practice cases and the GSI User's Guide. Using regional BUFR files for global applications will cause problems since the data only cover part of the analysis domain, but GSI can still read in the observations and perform the analysis.
- Fixed files: Section 3.1 of the GSI User's Guide introduced the notion that different operational systems have their own fixed files. These global fixed

files can be downloaded as a separate tar ball from the GSI user's website (http://www.dtcenter.org/com-GSI/users/downloads/index.php). For the GFS GSI application, the big difference is the background error covariance (BE). Different resolutions of the GFS backgrounds use their matched BE files, which are different from the BE files used by the regional GSI applications. In this release version, 14 BE files were provided for users:

```
1.
   global_berror.163y386.f77
2.
   global_berror.164y192.f77
global_berror.164y290.f77

```

5.4.2 Global GFS Scripts

Starting with release version 3.3, support for running GSI global applications was added to the community release. Specifically a sample global analysis run script was added to the ./ush directory named comgsi_run_gfs.ksh of the community release. This script comgsi_run_gfs.ksh is based on the GSI GFS regression tests. This script retains the same basic structure as the regional run script comgsi_run_regional.ksh, but includes additional details needed for the global analysis.

The first part of the global analysis run script, just as in the regional script, sets up the computer environment and case configuration. The primary differences between the global and regional scripts are the specification of the GFS case and the global application namelist.

```
GFSCASE=T62
GSI_NAMELIST=${GSI_ROOT}/ush/comgsi_namelist_gfs.sh
```

While the regional script simply specifies the background and BE files, the global script needs to know the background resolution by defining the following parameters:

```
# Set the JCAP resolution which you want.
# All resolutions use LEVS=64
if [[ "$GFSCASE" = "T62" ]]; then
    JCAP=62
    JCAP_B=62
elif [[ "$GFSCASE" = "T126" ]]; then
    JCAP=126
```

```
JCAP_B=126
elif [[ "$GFSCASE" = "enkf_glb_t254" ]]; then
   JCAP=254
   JCAP_B=254
elif [[ "$GFSCASE" = "T254" ]]; then
   JCAP=254
   JCAP_B=574
elif [[ "$GFSCASE" = "T574" ]]; then
   JCAP=574
   JCAP_B=1534
else
   echo "INVALID case = $GFSCASE"
   exit
fi
   LEVS=64
#
```

Just as with the regional analysis run script, the global script double checks the needed parameters, creates a run directory, and copies the background, observations, and fixed files into the run directory. It generates the namelist, and places it in the run directory as well.

1. Specify the values of LATA, LONA, DELTIME, resol based on the choice of JCAP:

```
# Given the requested resolution, set dependent resolution parameters
if [[ "\JCAP" = "382" ]]; then
  I.ONA=768
  LATA=384
  DELTIM=180
  resol=1
elif [[ "$JCAP" = "574" ]]; then
  LONA=1152
  LATA=576
  DELTIM=1200
  resol=2
elif [[ "$JCAP" = "254" ]]; then
  LONA=512
  LATA=256
  DELTIM=1200
  resol=2
elif [[ "$JCAP" = "126" ]]; then
  LONA=256
  I.ATA=128
  DELTIM=1200
  resol=2
elif [[ "$JCAP" = "62" ]]; then
  LONA=192
  I.ATA=94
  DELTIM=1200
  resol=2
else
  echo "INVALID JCAP = $JCAP"
   exit
NLAT=' expr $LATA + 2 '
```

2. Set up CO2, CH4, N2O, CO file decisions:

3. Set up the namelist parameters and generate the namelist:

```
# Set some parameters for use by the GSI executable and to build the namelist
echo " Build the namelist "
vs_op='0.7,'
hzscl_op='1.7,0.8,0.5,'
...
# Build the GSI namelist on-the-fly
. $GSI_NAMELIST
```

4. Multiple time level backgrounds are needed:

```
if [[ "$GFSCASE" = "enkf_glb_t62" ]]; then
 cp $BK_ROOT/bfg_${gdate}_fhr03_ensmean ./sfcf03
 cp $BK_ROOT/bfg_${gdate}_fhr06_ensmean ./sfcf06
 cp $BK_ROOT/bfg_${gdate}_fhr09_ensmean ./sfcf09
 cp $BK_ROOT/sfg_${gdate}_fhr03_mem001
                                          ./sigf03
 cp $BK_ROOT/sfg_${gdate}_fhr06_mem001
                                          ./sigf06
 cp $BK_ROOT/sfg_${gdate}_fhr09_mem001
                                          ./sigf09
 cp $BK_ROOT/sfcf03 ./sfcf03
 cp $BK_ROOT/sfcf06 ./sfcf06
 cp $BK_ROOT/sfcf09 ./sfcf09
 cp $BK_ROOT/sigf03 ./sigf03
 cp $BK_ROOT/sigf06 ./sigf06
 cp $BK_ROOT/sigf09 ./sigf09
```

Both surface and atmosphere files at 03, 06, and 09 hour forecasts are needed.

5. Link observations files:

```
# Link to the prepbufr data
ln -s ${PREPBUFR} ./prepbufr

# Link to the other observation data
if [ -r "${OBS_ROOT}/satwnd" ]; then
    ln -s ${OBS_ROOT}/satwnd .
fi
if [ -r "${OBS_ROOT}/gpsrobufr" ]; then
    ln -s ${OBS_ROOT}/gpsrobufr .
fi
if [ -r "${OBS_ROOT}/ssmirrbufr" ]; then
    ln -s ${OBS_ROOT}/ssmirrbufr" ]; then
    ln -s ${OBS_ROOT}/ssmirrbufr .
fi
.......
```

Table 5.3 lists the grid dimensions for GFS of different resolutions from *Running Global Model Parallel Experiments Version 7.0* from NCEP/EMC, which may provide users more information on the above mentioned resolution parameters.

Table 5.3: The grid dimensions for GFS.

	EULERIAN		SEMI-LA	GRANGIAN
SPECTRAL	LONB	LATB	LONB	LATB
RESOLUTION				
T62	192	94	128	64
T126	384	190	256	128

The majority of these files existed after running the GSI regional analysis examples in section 3.2.3 of the Basic User's Guide, and they provide the same information about the GSI run. Of note, the GSI global analysis run includes more radiance observations, resulting in more radiance diag files in this list. Instead of the single background file wrf_inout as seen with the regional analysis, the global analysis background is split between the two files siganl, for the atmosphere, and sfcanl.gsi for the surface. A quick check of the standard output file stdout shows information similar to that generated by the regional runs for the namelist, data ingest, and minimization, but is quite different with respect to information on the background IO.

Please visit our online tutorial for more details regarding how to conduct a global GSI run.

5.5 Introduction to Chemical Analysis

The GSI has also been developed to analyze chemical observations, such as MODIS AOD or PM2.5, to improve the pollution forecasts with chemical models. In this release, GSI can do the following chemical analyses:

case	Chemical Model	background species	Observations
1	WRF-Chem	GOCART	MODIS AOD
2	WRF-Chem	GOCART	PM2.5
3	WRF-Chem	PM2.5	PM2.5
4	CMAQ	CMAQ	PM2.5

Table 5.4: List of GSI chemical analyses

The GSI run script for a chemical analysis (./ush/comgsi_run_chem.ksh) and associated namelist (./ush/comgsi_namelist_chem.sh) are provided with this release. Sample background and observation files are provided through the on-line tutorial.

5.5.1 Setup GSI Run Scripts for Chemical Analysis

The script comgsi_run_chem.ksh was built based on regional GSI run scripts and has a similar structure to the regional run script comgsi_run_regional.ksh, but include a couple of differences.

The first part of the run script sets up the computer environment and case configuration. This is similar to the regional analysis run scripts, except for the specification of (bk_core and obs_type) for a given chemical case, and the namelist for the chemical application:

GSI_NAMELIST=\${GSI_ROOT}/ush/comgsi_namelist_chem.sh

The choices of (bk_core and obs_type) for a chemical case need to match with the options PREPBUFR and BK_FILE, which set background and observation files. Table 5.5 shows how to set up these two options for each case:

		,
case	background (BK_FILE; bk_core)	Observation (PREPBUFR; obs_type)
1	wrfinput_enkf_d01_2012-06-03_18:00:00;	Aqua_Terra_AOD_BUFR:2012-06-03_00:00:00;
	WRFCHEM_GOCART	MODISAOD
2	wrfinput_enkf_d01_2012-06-03_18:00:00;	anow.2012060318.bufr;
	WRFCHEM_GOCART	PM25
3	wrfinput_enkf_d01_2012-06-03_18:00:00;	anow.2012060318.bufr;
	WRFCHEM_PM25	PM25
4	cmaq2gsi_4.7_20130621_120000.bin;	anow.2013062112.bufr;
	CMAQ	PM25

Table 5.5: List of GSI chemical analyses.

Similar to the regional run script, this chemical run script will also double check the needed parameters. Then it creates a run directory, generates the namelist, and copies the background, observations, and fixed files into the run directory. Users who run the cases listed in table 5.4 do not need to change the rest of the run script. But users who need to build new cases may need to know the differences between chemical and regional applications, which is shown below.

1. Specify the name of the background and observations:

```
# Bring over background field (it's modified by GSI so we can't link to it)

if [ ${bk_core} = WRFCHEM_GOCART ] ; then
    cp ${BK_FILE} ./wrf_inout

fi

if [ ${bk_core} = WRFCHEM_PM25 ] ; then
    cp ${BK_FILE} ./wrf_inout

fi

if [ ${bk_core} = CMAQ ] ; then
    cp ${BK_FILE} ./cmaq_in.bin

fi

# Link to the observation data

if [ ${obs_type} = MODISAOD ] ; then
    ln -s ${PREPBUFR} ./modisbufr

fi

if [ ${obs_type} = PM25 ] ; then
    ln -s ${PREPBUFR} ./pm25bufr

fi
```

2. Specify the background error file and anavinfo:

```
if [ ${bk_core} = WRFCHEM_GOCART ] ; then
   BERROR=${FIX_ROOT}/wrf_chem_berror_little_endian
   BERROR_CHEM=${FIX_ROOT}/wrf_chem_berror_little_endian
   ANAVINFO=${FIX_ROOT}/anavinfo_wrfchem_gocart
fi
if [ ${bk_core} = WRFCHEM_PM25 ] ; then
   BERROR=${FIX_ROOT}/wrf_chem_berror_little_endian
   BERROR_CHEM=${FIX_ROOT}/wrf_chem_berror_little_endian
   ANAVINFO=${FIX_ROOT}/anavinfo_wrfchem_pm25
fi
```

```
if [ ${bk_core} = CMAQ ] ; then
   BERROR=${FIX_ROOT}/cmaq_berror_little_endian
   BERROR_CHEM=${FIX_ROOT}/cmaq_berror_little_endian
   ANAVINFO=${FIX_ROOT}/anavinfo_cmaq_pm25
fi
```

3. Specify the options for building the namelist:

```
if [ ${bk_core} = WRFCHEM_GOCART ] ; then
 bk_core_arw='.true.'
 bk_if_netcdf='.true.'
 bk_core_cmaq='.false.'
 bk_wrf_pm2_5='.false.'
bk_laeroana_gocart='.true.'
fi
if [ ${bk_core} = WRFCHEM_PM25 ] ; then
bk_core_arw='.true.'
 bk_if_netcdf='.true.'
 bk_core_cmaq='.false.'
bk_wrf_pm2_5='.true.'
bk_laeroana_gocart='.false.'
fi
if [ ${bk_core} = CMAQ ] ; then
bk_core_arw='.false.'
 bk_if_netcdf='.false.'
 bk_core_cmaq='.true.'
bk_wrf_pm2_5='.false.'
bk_laeroana_gocart='.false.'
```

5.5.2 Sample Results

In this section, case two in Table 5.4 will be used as an example. After a successful run of the GSI Chem analysis, the contents of the run directory, with the clean option turned on, will look something like this:

aeroinfo	fit_rad1.2012060318	fort.210	fort.225	gsiparm.anl	satbias_out.int
anavinfo	fit_t1.2012060318	fort.212	fort.226	gsi.x	satbias_pc_in

                                                                                   0.0000000000E+00
```

2. Analysis increments: After successfully running GSI, the analysis increments should be checked to see if data impacts are reasonable.

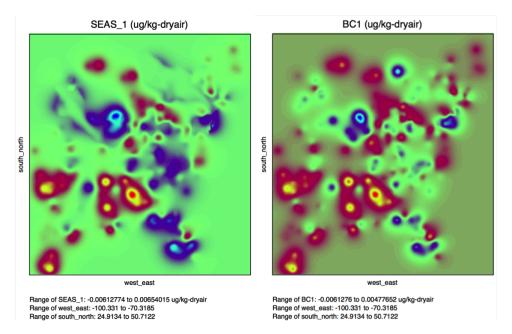

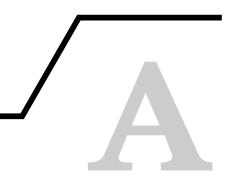

Figure 5.6: Analysis increments in the lowest level for SEAS_1 (left) and BC1 (right).

5.6 Summary

This chapter applied previous information outlined in the user's guide to demonstrate how to set up, run, and analyze GSI for various applications. It is important to always check for a successful GSI analysis, as running to completion does not always indicate a successful analysis was generated. Using the tools and methods described in this chapter, a complete picture of the GSI analysis can be obtained.

A.1 BUFR Format and BUFR Tools

Under ./util/bufr_tools, there are many Fortran examples to illustrate basic BUFR/PrepBUFR file process skills such as encoding, decoding, and appending. For details of these examples and the BUFR format, please see the BUFR/PrepBUFR User's Guide, which is freely available on-line

http://www.dtcenter.org/com-GSI/BUFR/docs/index.php

The observation BUFR files generated by NCEP (for example, PrepBUFR and BUFR files from NCEP ftp server or gdasl.tl2z.prepbufr.nr in tutorial case) are in Big Endian binary format. For release version older than 3.2, the BUFR files have to be converted from Big Endian BUFR file to Little Endian file when used by the GSI on Linux platform. Please refer to older version User's guide on how to convert.

Since release 3.2, BUFRLIB can automatically identify and handle either byte orders. For Intel and PGI compilers on Linux, the Big Endian BUFR/PrepBUFR files can be used by GSI without byte swap.

A.2 Read GSI Diagnostic Files

Lots of useful information about how one observation was used in the analysis such as innovation, observation values, observation error and adjusted observation error, and quality control information, has been saved in diagnostic files. To generate these diagnosis files,

namelist variable *write_diag* in namelist section & SETUP needs to be true. The *write_diag* variable has been introduced in Part 4 of Section 3.4. The following is an example of using the *write_diag* variable to control diagnostic files. When we set the number of outer loops to 2, and set the *write_diag* namelist variable to the following:

```
\label{lem:write_diag} \verb|write_diag|(2) = .false., \verb|write_diag|(3) = .true.|,
```

GSI will write out diagnostic files before the start of the 1st outer loop start (O-B) and after the completion of the 2nd outer loop finish (O-A). We don't want GSI to write out diagnosis files after the 1st outer loop because we set write_diag(2)=.false.

This is what we set in our example case described in section 5.2. From this case, we can see the following diagnostic files generated from the GSI analysis:

```
      diag_amsua_metop-a_anl.2014061700
      diag_amsua_n18_ges.2014061700

      diag_amsua_metop-a_ges.2014061700
      diag_conv_anl.2014061700

      diag_amsua_n15_anl.2014061700
      diag_conv_ges.2014061700

      diag_amsua_n15_ges.2014061700
      diag_hirs4_metop-a_anl.2014061700

      diag_amsua_n18_anl.2014061700
      diag_hirs4_metop-a_ges.2014061700
```

All files are identified with a filename containing three elements. The first element "diag" indicates these are combined diagnostic files. The second element identifies the observation type (here, "conv" means conventional observation from prepbufr and "amsua_n15" corresponds to radiance observation AMSU-A from NOAA 15). The last element identifies which step of outer loop the files were generated for. Here, "anl" means the contents were written after the last outer loop (from write_diag(3)=.true.) and "ges" means the contents were written before the first output loop (from write_diag(1)=.true.).

To help users to read the information from these diagnostic files, we have provided two Fortran programs in the ./util/Analysis_Utilities/read_diag/ directory:

read_diag_rad.f90 : Reads the diagnostic files for radiance observation. For example:

```
diag_amsua_n15_ges.2014061700 diag_hirs4_metop-a_anl.2014061700
diag_amsua_n18_anl.2014061700 diag_hirs4_metop-a_ges.2014061700
```

To compile the programs, use the makefile provided:

```
./make
```

Note: since information in the GSI *include* directory is required, the GSI must have been compiled first.

To run *read_diag_conv.exe*, a namelist file *namelist.conv* needs to be in the directory along with the executable. The namelist.conv only has two parameters:

The user can set the test case directory and file *diag_conv_anl.2014061700* from section 5.2 as the entry for *infilename* in the namelist, then run the executable

```
./read_diag_conv.exe
```

The results are placed in the file specified by the outfilename entry in the namelist. In this case that would be a file *results_conv_anl* located in the directory where the executable was run.

Similarly, to run *read_diag_rad.exe*, the namelist file namelist.rad is needed. It contains the same parameters as *namelist.conv* but it links to radiance diag files. After setting it to use the same case from section 5.2, such as:

```
&iosetup
  infilename='(test directory)/diag_amsua_n18_ges.2014061700',
  outfilename='./results_amsua_n18_ges',
//
```

Running the executable creates the text file *results_amsua_n18_ges* specified by the namelist in the directory *read_diag_rad.exe* runs.

For the conventional observations, the data is stored in two arrays: rdiagbuf and cdiagbuf. Their contents are listed as follows, for temperature (check src/main/setupt.f90) as an example:

```
cdiagbuf
            = station id
rdiagbuf(1) = observation type
rdiagbuf(2) = observation subtype
rdiagbuf(3) = observation latitude (degrees)
rdiagbuf(4) = observation longitude (degrees)
rdiagbuf(5) = station elevation (meters)
rdiagbuf(6) = observation pressure (hPa)
rdiagbuf(7) = observation height (meters)
rdiagbuf(8) = observation time (hours relative to analysis time)
rdiagbuf(9) = input prepbufr qc or event mark
rdiagbuf(10) = setup qc or event mark (currently qtflg only)
rdiagbuf(11) = read_prepbufr data usage flag
rdiagbuf(12) = analysis usage flag (1=use, -1=not used)
rdiagbuf(13) = nonlinear qc relative weight
rdiagbuf(14) = prepbufr inverse obs error (K**-1)
rdiagbuf(15) = read_prepbufr inverse obs error (K**-1)
rdiagbuf(16) = final inverse observation error (K**-1)
rdiagbuf(17) = observation (K)
rdiagbuf(18) = obs-ges used in analysis (K)
rdiagbuf(19) = obs-ges without bias correction (K)
```

For wind observations, the content after index 16 (check src/main/setupw.f90) is:

```
rdiagbuf(17) = earth relative u wind component observation (m/s)
```

```
rdiagbuf(18) = earth relative u obs-ges used in analysis (m/s)
rdiagbuf(19) = earth relative u obs-ges w/o bias correction (m/s)
rdiagbuf(20) = earth relative v wind component observation (m/s)
rdiagbuf(21) = earth relative v obs-ges used in analysis (m/s)
rdiagbuf(22) = earth relative v obs-ges w/o bias correction (m/s)
```

The *read_diag_conv.exe* reads these arrays and outputs important information in the text file *results_conv_anl* specified by the user in the *&iosetup* namelist. For example:

station	obs	obs	obs	obs	obs	usag	obs	0-B		
ID	type	time	latitude	longitude	pressure		value			
ps @ 46047	: 180	-0.17	32.40	240.50	1014.30	1	1014.30	-0.09		
t @ 72293	: 120	-0.98	32.85	242.88	996.00	1	297.25	1.26		
uv @ 72293	: 220	-0.98	32.85	242.88	996.00	1	3.90	0.38	3.30	2.66

For wind, the last 4 columns are the wind components in the order of: U observation, O-B for U, V observation, O-B for V.

For radiance observations, the data is stored in two arrays: *diagbuf* and *diagbufchan*. Their contents are listed as follows (please refer to *src/main/setuprad.f90* for more details):

```
diagbuf(1) = observation latitude (degrees)
 diagbuf(2) = observation longitude (degrees)
 diagbuf(3) = model (guess) elevation at observation location
 diagbuf(4) = observation time (hours relative to analysis time)
 diagbuf(5) = sensor scan position
 diagbuf(6) = satellite zenith angle (degrees)
 diagbuf(7) = satellite azimuth angle (degrees)
 diagbuf(8) = solar zenith angle (degrees)
 diagbuf(9) = solar azimuth angle (degrees)
 diagbuf(10) = sun glint angle (degrees) (sgagl)
 diagbuf(11) = surface fractional coverage by water
 diagbuf(12) = surface fractional coverage by land
 diagbuf(13) = surface fractional coverage by ice
 diagbuf(14) = surface fractional coverage by snow
if(.not. retrieval)then
 diagbuf(15) = surface temperature over water (K)
 diagbuf(16) = surface temperature over land (K)
 diagbuf(17) = surface temperature over ice (K)
 diagbuf(18) = surface temperature over snow (K)
 diagbuf(19) = soil temperature (K)
 diagbuf(20) = soil moisture
 diagbuf(21) = surface land type
else
 diagbuf(15) = SST first guess used for SST retrieval
 diagbuf(16) = NCEP SST analysis at t
 diagbuf(17) = Physical SST retrieval
 diagbuf(18) = Navy SST retrieval
 diagbuf(19) = d(ta) corresponding to sstph
 diagbuf(20) = d(qa) corresponding to sstph
 diagbuf(21) = data type
endif
 diagbuf(22) = vegetation fraction
 diagbuf(23) = snow depth
 diagbuf(24) = surface wind speed (m/s)
   Note: The following quantities are not computed for all sensors
 if (.not.microwave) then
    diagbuf(25) = cloud fraction (%)
    diagbuf(26) = cloud top pressure (hPa)
     diagbuf(25) = cloud liquid water (kg/m**2)
    diagbuf(26) = total column precip. water (km/m**2)
 endif
```

```
diagbuf(27) = foundation temperature: Tr diagbuf(28) = diurnal warming: d(Tw) at depth zob diagbuf(29) = sub-layer cooling: d(Tc) at depth zob diagbuf(30) = d(Tz)/d(Tr)
```

diagbufchan include loop through channel *i* from 1 to *nchanl*:

```
diagbufchan(1,i)= observed brightness temperature (K) diagbufchan(2,i)= observed - simulated Tb with bias corrrection (K) diagbufchan(3,i)= observed - simulated Tb with no bias correction (K) diagbufchan(4,i)= inverse observation error diagbufchan(5,i)= quality control mark or event indicator diagbufchan(6,i)= surface emissivity diagbufchan(7,i)= stability index diagbufchan(8,i)= d(Tb)/d(Ts) do j=1,npred+1 diagbufchan(7+j,i)= Tb bias correction terms (K) end do
```

In the sample output file *results_amsua_n18_ges*, only the observation location and time are written in the file. Users can write out other information based on the list.

A.3 Read and Plot Convergence Information from fort.220

In section 4.6, we introduced how to check the convergence information in the *fort.220* file. Further detail on the *fort.220* convergence information can be found in the Advanced User's Guide. Here, we provide tools to filter this file and to plot the values of the cost function and the norm of gradient during each iteration.

These tools - one ksh script and one ncl script - are in: ./util/Analysis_Utilities/plot_cost_grad directory:

The ksh script, *filter_fort220.ksh*, only has one line:

```
grep 'cost,grad,step,b' fort.220 | sed -e 's/cost,grad,step,b,step? = //g' | sed -e 's/good//g' > cost_gradient.txt
```

To run *filter_fort220.ksh*, the *fort.220* needs to be in the same directory. The script will filter out the values of the cost function and the norm of gradient at each iteration from *fort.220* into a text file called *cost_gradient.txt*.

Once the file *cost_gradient.txt* is ready, run ncl script *GSI_cost_gradient.ncl* to generate the plot:

```
ncl GSI_cost_gradient.ncl
```

The pdf file GSI_cost_gradient.pdf is created. The pdf file contains plots of the convergence of the GSI analysis like those in section 4.6.

A.4 Plot Single Observation Test Result and Analysis Increment

In Section 4.2, we introduced how to do a single observation test for GSI. Here we provide users with the ncl scripts to plot the single observation test results.

There are 5 ncl scripts in the *util/Analysis_Utilities/plots_ncl* directory:

GSI_singleobs_arw.ncl

GSI_singleobs_nmm.ncl

Plot single observation test with ARW NetCDF background

Plot single observation test with NMM NetCDF
background

Analysis_increment.ncl

Plot analysis increment from the case with ARW
NetCDF background

Analysis_increment_nmm.ncl

Plot analysis increment from the case with NMM
NetCDF background

fill_nmm_grid2.ncl

E grid to A grid convertor

Table A.1: the list of ncl plotting tools

The main difference between the ARW and NMM core used in GSI is that ARW is on a C grid, while NMM is on an E grid. *GSI_singleobs_nmm.ncl* calls *fill_nmm_grid2.ncl* to convert the E grid to an A grid for plotting, while *GSI_singleobs_arw.ncl* itself includes a C grid to A grid convertor.

Before running ncl scripts, users need to set up two links:

- cdf_analysis Link to analysis result in NetCDF format (wrf_inout)
- *cdf_bk* Link to background file in netCDF format

These scripts read in the analysis and background fields of temperature (T), U component of wind (U), V component of wind (V), and moisture (Q) and calculate the difference of the analysis field minus the background field. Then XY sections (left column) and XZ sections (right column) are plotted for T, U, V, and Q through the point that has maximum analysis increment of single observation. Here the default single observation test is T. If the user conducts other single observation tests, the corresponding changes should be made based on the current scripts.

The scripts *Analysis_increment.ncl* and *Analysis_increment_nmm.ncl* are very similar the one for the single observation but only the XY section for a certain analysis level is plotted.

For more information on how to use ncl, please check the NCL website at:

http://www.ncl.ucar.edu/

A.5 Generate initial regional ensembles

Under the ./util/EnKF/arw/src directory, there are two sub-directories: enspreproc_regional.fd/ and initialens_regional.fd/. The first one is to extract ensemble pertubations from GDAS 80 member ensembles and the second one is to add the extracted ensemble perturbations to a regional WRF background field (considered as the mean filed) to generate initial regional ensembles.

Before using these two unitilies, you should have already successfully compiled the GSI and gotten the "gsi.x" file. After that, under the build directory, type "cmake - DBUILD_UTIL_COM path_to_comGSI" to compile the utilities. A successful compilation should yield "enspreproc.x" and "initialens.x" in the bin/ directory.

Now, the next step is to get GDAS spectrally smoothed atmospheric ensemble forecasts. The old GDAS ensemble files are in the sigma format. You need to contact NCEP or other appropriate contacts to download these kind of ensembles. These ensemble files follow the name convection of "sfg_\$CDATE_fhr\$FEs_mem\$MEM". \$CDATE is the cycle date, such as 2017011518 which means 18z of Jan. 15th, 2017. \$FE is the forecast hour, for example, 06 means 6 hour of forecasts. \$MEM is the member number. Here is an example of GDAS ensembles: sfg_2017011518_fhr06s_mem001. After GFS system update in early 2017, the GDAS ensembles are in NESMIO format. The name convention for NEMSIO format GDAS ensemble files follows "gdas.t\${HR}z.atmf\${FE}s.mem\${MEM}.nemsio". The FE and MEM have the smae means as old ones and HR is cycling hour. For example, gdas.t00z.atmf006s.mem001.nemsio.

After you download the required GDAS ensembles, follow the following steps:

- 1. Running "enspreproc.exe", enter the <code>enspreproc_regional.fd/</code> directory:
- (1). generate the file "fileslist01". This file lists the ensemble files to be used in the calculation of ensemble pertubations. For example, if it is determined to use 20 members to generate ensemble perturbations, the file "filelist01" will be as follows:

```
sfg_2017011518_fhr06s_mem001
sfg_2017011518_fhr06s_mem002
sfg_2017011518_fhr06s_mem003
...
sfg_2017011518_fhr06s_mem018
sfg_2017011518_fhr06s_mem019
sfg_2017011518_fhr06s_mem020
```

- (2). Modify the file "namelist.input", change "n_ens" to the total number of ensembles to be used. For old GFS binary format ensemble files, the namelist option "use_gfs_nemsio" needs to be ".false.", while for NEMSIO format files, it needs to be ".true.".
- (3). Copy the "anavinfo" file used by GSI into current directory.
- (4). Copy the background WRF file, name it as "wrf_inout".
- (5). Create a job description file, submit the job to get it run in parallel.

After the successful running of "enspreproc.x", you will get ensemble perturbations as follows:

```
en_perts4ars.mem0001
en_perts4ars.mem0002
en_perts4ars.mem0003
...
en_perts4ars.mem0018
en_perts4ars.mem0019
en_perts4ars.mem0020
```

- 2. Runnning "initialens.x", enter the initialens_regional.fd/ directory:
- (1). Modify the file "namelist.input", change "n_ens" to the total number of ensembles to be used.
- (2). Copy wrf_inout to current directry
- (3). Copy wrf_inout to wrfinput_d01.mem\$MEM files as follows:

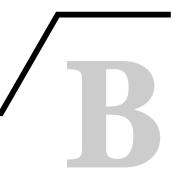

```
cp wrf_inout wrfinput_d01.mem0001
cp wrf_inout wrfinput_d01.mem0002
cp wrf_inout wrfinput_d01.mem0003
...
cp wrf_inout wrfinput_d01.mem0018
cp wrf_inout wrfinput_d01.mem0019
cp wrf_inout wrfinput_d01.mem0020
```

Be sure that each member has a correspoding wrfinput_d01 file. These files will be updated by "initialens.x" later.

- (4). Link the ensemble perturbations generated by "enspreproc.x" to current directory. Something like this *ln -s ../enspreproc_regional.fd/en_perts4arw.mem**.
- (5). Create a job description file, submit the job to get it run in parallel. Please note that only 1 processor is required to run "initialens.x" but submitting it to run on computing node is a must.

After the sucessful running of "initialens.x", all the *wrfinput_d01.mem\$MEM* files are updated with ensemble perturbation added to the background or "mean" state of the original wrf inout.

Now the initial regionl ensembles have been successfully generated.

GSI Namelist: Name, Default

Value, Explanation

The following are lists and explanations of the GSI namelist variables. You can also find them in the source code <code>gsimod.F90</code>.

Variable name	Default value	Description
SETUP		General control namelist
gencode	80	source generation code
factqmin	1	weighting factor for negative moisture constraint
factqmax	1	weighting factor for supersaturated moisture constraint
clip_supersaturation	.false.	flag to remove supersaturation during each outer loop
factv	1	weighting factor for negative visibility constraint
factl		
factp		
factg		
factw10m		
facthowv		
deltim	1200	model timestep
dtphys	3600	physics timestep
biascor	-1	background error bias correction coefficient
bcoption	1	0=ibc (no bias correction to bkg);
		1= sbc(original implementation)
diurnalbc	0	1= diurnal bias; 0= persistent bias

Variable name	Default value	Description
SETUP		General control namelist
niter(0:50)	0,	Maximum number of inner loop iterations for each outer loop
niter_no_qc(0:50)	1000000	Inner loop iteration at which to turn on variational quality control
miter	1	number of outer loops
qoption	1	option for moisture analysis variable; 1:q/qsatg 2:normalized RH
cwoption		
pseudo_q2	.false.	breed between q1/q2 options, that is, (q1/sig(q))
nhr_assimilation	6	assimilation time interval (currently 6 hours for global, 3 hours for regional)
min_offset	3	time of analysis in assimilation window
iout_iter	220	output file number for iteration information
npredp	6	number of predictors for precipitation bias correction
retrieval	.false.	logical to turn off or on the SST physical retrieval
nst_gsi	0	indicator to control the Tr Analysis mode:
		0 = no nst info ingsi at all;
		1 = input nst info, but used for monitoring only
		2 = input nst info, and used in CRTM simulation, but no Tr
		analysis
		3 = input nst info, and used in CRTM simulation and Tr anal-
		ysis is on
nst_tzr	0	indicator to control the Tzr_QC mode:
		0 = no Tz retrieval;
		1 = Do Tz retrieval and applied to QC
nstinfo	0	number of nst variables
fac_dtl	0	index to apply diurnal thermocline layer or not: 0 = no; 1 =
C 1	0	yes
fac_tsl	0	index to apply thermal skin layer or not: 0 = no; 1 = yes.
nst_tzr	C 1	
tzr_bufrsave	.false.	logical to turn off or on the bufr Tz retrieval file true=on
diag_rad	.true.	logical to turn off or on the diagnostic radiance file (true=on)
diag_pcp	.true.	logical to turn off or on the diagnostic precipitation file
1.		(true=on)
diag_conv	.true.	logical to turn off or on the diagnostic conventional file
1	4	(true=on)
diag_ozone	.true.	logical to turn off or on the diagnostic ozone file (true=on)
diag_aero	.false.	logical to turn off or on the diagnostic aerosol file (true=on)
diag_co	.false.	logical to turn off or on the diagnostic carbon monoxide file
iguess	1	(true=on) flag for guess solution (currently not working)
iguess	1	-1 do not use guess file
		0 write only guess file
		1 read and write guess file
		2 read only guess file
write_diag	.false.,	logical to write out diagnostic files for outer iteration
reduce_diag	.false.,	namelist logical to produce reduced radiance diagnostic files
reduce_diag	.1a15C.	namens, logical to produce reduced fadiance diagnostic mes

Variable name	Default value	Description
SETUP		General control namelist
oneobtest	.false.	one observation test flag true=on
sfcmodel	.false.	if true, then use boundary layer forward model for surface
		temperature data.
dtbduv_on	.true.	logical for switching on (.true.) sensitivity of uv winds to
		microwave brightness temperatures. if true, use d(microwave
		brightness temperature)/d(uv wind) in inner loop
ifact10	0	flag for recomputing 10m wind factor
		= 1 compute using GFS surface physics
		= 2 compute using MM5 surface physics
		= 0 or any other value - DO NOT recompute - use value from
		guess file
l_foto	.false.	option for First-Order Time extrapolation to observation
offtime_data	.false.	if true, then allow use of obs files with ref time different from
		analysis time. default value = .false., in which case analysis
		fails if observation file reference time is different from analysis
		time.
npred_conv_max	0	maximum number of conventional observation bias correction
		coefficients
id_bias_ps	0	prepbufr id to have conv_bias added for testing
id_bias_t	0	prepbufr id to have conv_bias added for testing
id_bias_spd	120	prepbufr id to have conv_bias added for testing
conv_bias_ps	0	magnitude of ps bias(mb)
conv_bias_t	0	magnitude of t bias(deg K)
conv_bias_spd	0	magnitude of spd bias(m/sec)
id_bias_pm2_5		
conv_bias_pm2_5		
id_bias_pm10		
conv_bias_pm10		
stndev_conv_ps	1.0	
stndev_conv_t	1.0	
stndev_conv_spd	1.0	
use_pbl	.false.	Logical flag to include PBL effects in tendency model.
use_compress	.false.	option to turn on the use of compressibility factors in geopo-
		tential heights
nsig_ext	13	number of layers above the model top which are necessary to
		compute the bending angle for gpsro
gpstop	30.0	maximum height for gpsro data assimilation. Reject anything
		above this height. (km)
perturb_obs	.false.	logical flag to perturb observation (true=on)
perturb_fact	1	magnitude factor for observation perturbation
oberror_tune	.false.	logical to tune (=true) oberror
preserve_restart_date	.false.	if true, then do not update regional restart file date.
crtm_coeffs_path		path of directory w/ CRTM coeffs files
berror_stats	berror_stats	filename if other than "berror_stats"
newpc4pred	.false.	option for additional preconditioning for pred coeff
adp_anglebc	.false.	option to perform variational angle bias correction
angord	0	order of polynomial for variational angle bias correction

Variable name	Default value	Description
SETUP		General control namelist
passive_bc	.false.	option to turn on bias correction for passive (monitored) channels
use_edges	.true.	option to exclude radiance data on scan edges
biaspredvar	0.1	set background error variance for radiance bias coeffs
lobsdiagsave	.false.	write out additional observation diagnostics
l4dvar	.false.	turn 4D-Var on/off (default=off=3D-Var)
lbicg	.false.	use B-precond w/ bi-conjugate gradient for minimization
lsqrtb	.false.	Use sqrt(B) preconditioning
lcongrad	.false.	Use conjugate gradient/Lanczos minimizer
lbfgsmin	.false.	Use L-BFGS minimizer
ltlint	.false.	Use TL inner loop (ie TL intall)
nhr_obsbin	-1	length of observation bins
nhr_subwin	-1	length of weak constraint 4d-Var sub-window intervals
nwrvecs	-1	Number of precond vectors (Lanczos) or pairs of vectors (QN) being saved
iorthomax	0	max number of vectors used for orthogonalization of various CG options
ladtest	.false.	Run adjoint test
ladtest_obs	.false.	if true, doing the adjoint check for the observation operators
lgrtest	.false.	Run gradient test
lobskeep	.false.	keep obs from first outer loop for subsequent OL
lsensrecompute	.false.	does adjoint by recomputing forward solution
jsiga	-1	calculate approximate analysis errors from lanczos for jiter=jsiga
ltcost	.false.	calculate true cost when using Lanczos (this is very expensive)
lobsensfc	.false.	compute forecast sensitivity to observations
lobsensjb	.false.	compute Jb sensitivity to observations
lobsensincr	.false.	compute increment sensitivity to observations
lobsensadj	.false.	use adjoint of approx. Hessian to compute obs sensitivity
lobsensmin	.false.	use minimisation to compute obs sensitivity
iobsconv	0	compute convergence test in observation space =1 at final point, =2 at every iteration
idmodel	.false.	uses identity model when running 4D-Var (test purposes)
iwrtinc	.false.	when .t., writes out increments instead of analysis
jiterstart	1	first outloop iteration number
jiterend	1	last outloop iteration number
lobserver	.false.	when .t., calculate departure vectors only
lanczosave	.false.	save lanczos vectors for forecast sensitivity computation
llancdone	.false.	use to tell adjoint that Lanczos vecs have been pre-computed
lferrscale	.false.	Something related to forecast error
print_diag_pcg	.false.	logical turn on of printing of GMAO diagnostics in pcgsoi.f90
tsensible	.false.	option to use sensible temperature as the analysis variable. Works only for twodvar_regional=.true.
lgschmidt	.false.	option for re-biorthogonalization of the gradx and grady set from pcgsoi when twodvar_regional=.true.

Variable name	Default value	Description
SETUP		General control namelist
lread_obs_save	.false.	option to write out collective obs selection info
lread_obs_skip	.false.	option to read in collective obs selection info
use_gfs_ozone	.false.	option to read in gfs ozone and interpolate to regional model
		domain
check_gfs_ozone_date	.false.	option to date check gfs ozone before interpolating to regional
		model domain
regional_ozone	.false.	option to turn on ozone in regional analysis
lwrite_predterms	.false.	option to write out actual predictor terms instead of predicted
		bias to the radiance diagnostic files
lwrite_peakwt	.false.	option to writ out the approximate pressure of the peak of the
		weighting function for satellite data to the radiance diagnostic
		files
use_gfs_nemsio	.false.	option to use nemsio to read global model NEMS/GFS first
		guess
liauon	.false.	treat 4dvar CV as tendency perturbation (default=false)
use_prepb_satwnd	.false.	allow using satwnd's from prepbufr (historical) file
l4densvar	.false.	logical to turn on ensemble 4dvar
ens4d_nstarthr	3	start hour for ensemble perturbations (generally should match
		min_offset)
use_gfs_stratosphere		When true, a guess gfs valid at the same time as the nems-
		nmmb guess is used to replace the upper levels with gfs values.
		The purpose of this is to allow direct use of gdas derived sat
		radiance bias correction coefs.
pblend0	152	The nems-nmmb vertical coordinate is smoothly merged with
		gfs above this level. Below this level, is original nems-nmmb.
pblend1	79.0	The nems-nmmb vertical coordinate is smoothly merged with
		gfs below this level. Above this level,is gfs.
step_start	1.e-4	initial stepsize in minimization
diag_precon	.false.	if true do preconditioning
lrun_subdirs	.false.	logical to toggle use of subdirectires at runtime for pe specific
		files
emiss_bc	.false.	option to turn on emissivity bias predictor
upd_pred	1	bias update indicator for radiance bias correction; 1.0=bias cor-
a	0.1	rection coefficients evolve
use_reflectivity	.false.	option of using reflectivity
lnested_loops	.false.	allow for nested resolution outer/inner loops
lwrite4danl	.false.	logical to write out 4d analysis states if 4dvar or 4denvar mode
lsingleradob	.false.	logical for single radiance observation assimilation. Uses ex-
		isting bufr file and rejects all radiances that don't fall within a
.1 1	1	tight threshold around oblat/oblon (SINGLEOB_TEST)
ssmis_method	1	choose method for SSMIS noise reduction 0=no smoothing l=default
ssmis_precond	0.01	weighting factor for SSMIS preconditioning (if not using
ssims_precond	0.01	newpc4pred)
R_option	.false.	Option to use variable correlation length for lcbas based
- r		on data density - follows Hayden and Purser (1995) (twod-
		var_regional only)
	l	- ''
thin4d		

Variable name	Default value	Description
GRIDOPTS		Grid setup variables, including regional specific variables
jcap	62	spectral resolution of the analysis
jcap_b	62	spectral resolution of background (model guess field)
nsig	42	number of sigma levels
nlat	96	number of latitudes
nlon	384	number of longitudes
hybrid	logical	hybrid data file flag true=hybrid
nlat_regional	0	Number of y grid point in whole regional domain
nlon_regional	0	Number of x grid point in whole regional domain
diagnostic_reg	.false.	logical for regional debugging
update_regsfc	.false.	logical to write out updated surface fields to the regional anal-
		ysis file (default = false)
netcdf	.false.	if true, then wrf files are in netcdf format, otherwise wrf files
		are in binary format.
regional	.false.	logical for regional GSI run
wrf_nmm_regional	.false.	logical for input from WRF NMM
nems_nmmb_regional	.false.	logical for input from NEMS NMMB
wrf_mass_regional	.false.	logical for input from WRF MASS-CORE (ARW)
twodvar_regional	.false.	logical for regional 2d-var analysis
filled_grid	.false.	logical to fill in points on WRF-NMM E-grid
half_grid	.false.	logical to use every other row of WRF-NMM E-Grid
nvege_type	24	number of types of vegetation; old=24, IGBP=20
nlayers(100)	1	number of sub-layers to break indicated model layer into prior
		to calling radiative transfer model
cmaq_regional	.false.	Background input is from CMAQ model
nmmb_reference_grid	H	='H', then analysis grid covers H grid domain
		= 'V', then analysis grid covers V grid domain
grid_ratio_nmmb	sqrt(2)	ratio of analysis grid to nmmb model grid in nmmb model grid
		units.
grid_ratio_wrfmass	1.0	ratio of analysis grid to wrf mass grid in wrf grid units
jcap_gfs		spectral truncation used to transform high wavenum-
		ber spectral coefficients to a coarser resolution grid,when
		use_gfs_ozone = .true. or use_gfs_stratosphere = .true.
jcap_cut		
use_sp_eqspac	.false.	if .true., then ensemble grid is equal spaced, staggered 1/2 grid
		unit off poles. if .false., then gaussian grid assumed for ensem-
		ble (global only)

Variable name	Default value	Description
BKGERR		Background error related variables
VS	1/1.5	scale factor for vertical correlation lengths for background er-
		ror
nhscrf	3	number of horizontal scales for recursive filter
hzscl(3)	1, 1, 1	scale factor for horizontal smoothing, n=1,number of scales (3
		for now)
		specifies factor by which to reduce horizontal scales (i.e. 2
		would then apply 1/2 of the horizontal scale)
hswgt(3)	1/3, 1/3, 1/3	empirical weights to apply to each horizontal scale
norh	2	order of interpolation in smoothing
ndeg	4	degree of smoothing in recursive filters
noq	3	1/4 of accuracy in compact finite differencing
bw	0	factor in background error calculation
norsp	0	order of interpolation for smooth polar cascade routine de-
		fault is norsp=0, in which case norh is used with original polar
		cascade interpolation (global only).
fstat	.false.	logical to separate f from balance projection
pert_berr	.false.	logical to turn on random inflation/deflation of background
		error tuning parameters
pert_berr_fct	0	factor for increasing/decreasing berror parameters, this is mul-
		tiplied by random number
bkgv_flowdep	.false.	flag to turn on flow dependence to background error variances
bkgv_rewgtfct	0	factor used to perform flow dependent reweighting of error
		variances
bkgv_write	.false.	flag to turn on=.true. /off=.false. generation of binary file with
		reweighted variances
fpsproj	.true.	controls full nsig projection to surface pressure
fut2ps		controls the projection from unbalance T to surface pressure
adjustozvar		adjusts ozone variances in the stratosphere based on guess field
cwcoveqqcov		sets cw Bcov to be the same as B-cov(q) (presently glb default)

Variable name	Default value	Description
ANBKGERR		Anisotropic background error related variables
anisotropic	.false.	if true, then use anisotropic background error covariance
ancovmdl	0	covariance model settings - 0: pt-based, 1: ensemble based
triad4	.true.	for 2d variables, if true, use blended triad algorithm
ifilt_ord	4	filter order for anisotropic filters
npass	1	2ÃŮnpass = number of factors in background error
normal	200	number of random vectors to use for filter normalization (if
		< 0 then slightly slower, but results independent of number of
		processors)
binom	.true.	if true, weight correlation lengths of factors using binomial
		distribution, with shortest scales on outside, longest scales on
		inside. This can help to produce smoother correlations in the
		presence of strong anisotropy
ngauss	3	number of Gaussians to add together in each factor
rgauss	0	multipliers on reference aspect tensor for each Gaussian factor
anhswgt	1.0	empirical weights to apply to each gaussian
an_vs	1	scale factor for background error vertical scales (temporary
		carry over from isotropic inhomogeneous option)
grid_ratio	2.0	ratio of coarse to fine grid in fine grid units
grid_ratio_p	0	ratio of coarse to fine grid in fine grid units for polar patches
nord_f2a	4	order of interpolation for transfer operators between filter grid
		and analysis grid
an_flen_u	1	coupling parameter for connecting horizontal wind to back-
		ground error
an_flen_t	1	coupling parameter for connecting grad(potential temperature)
		to background error
an_flen_z	1	coupling parameter for connecting grad(terrain) to background
		error
rtma_subdomain_option	.false.	if true, then call alternative code which calls recursive filter
		directly from subdomain mode, bypassing transition to/from
		horizontal slabs. This is mainly to improve efficiency for
		2d rtma analysis. at the moment, this only works for twod-
		var_regional=.true. rtma_subdomain_option will be forced to
		false when twodvar_regional=.false.
lreadnorm	.false.	if true, then read normalization from fixed files
nsmooth	0	number of 1-2-1 smoothing passes before and after background
.1 1 .	0	error application
nsmooth_shapiro	0	number of 2nd moment preserving (shapiro) smoothing passes
		before and after background error application.
		NOTE: default for nsmooth and nsmooth_shapiro is 0.
- f - 40	0.0	if both are > 0, then nsmooth will be forced to zero.
afact0	0.0	anistropy effect parameter, the range must be in 0.0-1.0.
covmap	.false.	if true, covariance map would be drawn

Variable name	Default value	Description
JCOPTS		Constraint term in cost function (Jc)
ljcdfi	.false.	if .false., uses original formulation based on wind, temp, and
		ps tends
		when .t. uses digital filter initialization of increments (4dvar)
alphajc	10.0	parameter for digital filter
switch_on_derivatives	.false., âĂę	if true, then compute horizontal derivatives of all state vari-
		ables (to be used eventually for time derivatives, dynamic con-
		straints and observation forward models that need horizontal
		derivatives)
tendsflag	.false.	if true, compute time tendencies
ljcpdry	.false.	when .t. uses dry pressure constraint on increment
bamp_jcpdry	0.0	parameter for pdry_jc
eps_eer	-1.0	Errico-Ehrendofer parameter for q-term in energy norm
ljc4tlevs	.false.	when true and in 4D mode, apply any weak constraints over
		all time levels instead of just at a single time

Variable name	Default value	Description
STRONGOPTS		Strong dynamic constraint
reg_tlnmc_type	1	=1 for 1st version of regional strong constraint
		=2 for 2nd version of regional strong constraint
tlnmc_option	0	integer flag for strong constraint (various capabilities for hy-
		brid):
		=0: no TLNMC
		=1: TLNMC for 3DVAR mode
		=2: TLNMC on total increment for single time level only (for
		3D EnVar) or if 4D EnVar mode, TLNMC applied to increment
		in center of window
		=3: TLNMC on total increment over all time levels (if in 4D
		EnVar mode)
		=4: TLNMC on static contribution to increment ONLY for any
		EnVar mode
nstrong	0	if > 0, then number of iterations of implicit normal mode ini-
		tialization to apply for each inner loop iteration
period_max	1000000.0	cutoff period for gravity waves included in implicit normal
		mode initialization (units = hours)
period_width	1.0	defines width of transition zone from included to excluded
		gravity waves
nvmodes_keep	0	number of vertical modes to use in implicit normal mode ini-
		tialization
baldiag_full	.false.	flag to toggle balance diagnostics for the full fields
baldiag_inc	.false.	flag to toggle balance diagnostics for the analysis increment

Variable name	Default value	Description
OBSQC		Observation quality control variables
02220		Parameters used for gross error checks are set in file con-
		vinfo (ermin, ermax, ratio) Parameters below used for non-
		linear (variational) quality control
dfact	0	factor for duplicate observation at same location for conven-
arwer	Ü	tional data
dfact1	3.0	time factor for duplicate observation at same location for con-
		ventional data
erradar_inflate	1	radar error inflation factor
tdrerr_inflate	.false.	logical for tdr obs error inflation
tdrgross_fact	1	factor applied to tdr gross error
oberrflg	.false.	logical for reading in new observation error table (if set to true)
vadfile	'none'	character(10) variable holding name of VAD wind bufr file
noiqc	.false.	logical flag to bypass OI QC (if set to true)
c_varqc	1	constant number to control variance qc turning on speed
blacklst	.false.	logical for reading in raob blacklist (if set to true)
use_poq7	.false.	Logical to toggle accept (.true.) or reject (.false.) SBUV/2 ozone
		observations flagged with profile ozone quality mark
hilbert_curve	.false.	option for hilbert-curve based cross-validation. works only
		with twodvar_regional=.true.
tcp_refps	1000.0	reference pressure for tcps oberr calculation (mb)
tcp_width	50.0	parameter for tcps oberr inflation (width, mb)
tcp_ermin	0.75	parameter for tcps oberr inflation (minimum oberr, mb)
tcp_ermax	5.0	parameter for tcps oberr inflation (maximum oberr, mb)
qc_noirjaco3	.false.	controls whether to use O3 Jac from IR instruments
qc_noirjaco3_pole	.false.	controls wheter to use O3 Jac from IR instruments near poles
qc_satwnds	.true.	allow bypass sat-winds qc normally removing lots of mid-tropo
		obs
njqc		
vqc		
aircraft_t_bc_pof	.false.	logical for aircraft temperature bias correction, pof is used for
_		predictor
aircraft_t_bc	.false.	logical for aircraft temperature bias correction
aircraft_t_bc_ext	.false.	logical for reading aircraft temperature bias correction from
		external file
buddycheck_t	.false.	When true, run buddy check algorithm on temperature obser-
		vations
buddydiag_save	.false.	When true, output files containing buddy check QC info for all
		obs run through the buddy check
biaspredt	1	berror var for temperature bias correction coefficients
upd_aircraft	.true.	indicator if update bias at 06Z & 18Z
cleanup_tail	.false.	logical to remove tail number no longer used

${\it C. GSI Name list: Name, Default \ Value, Explanation}$

Variable name	Default value	Description
OBS_INPUT		Controls input data
dfile	, ,	input observation file name
dtype	, ,	observation type
dplat	, ,	satellite (platform) id (for satellite data)
dsis	, ,	sensor/instrument/satellite flag from satinfo files
dthin	, ,	satellite group
dval	, ,	relative value of each profile within group relative weight for
		observation = dval/sum(dval) within grid box
dmesh(max(dthin))		thinning mesh for each group
		mesh size (km) for radiance thinning grid (used in satthin)
dsfcalc	, ,	specifies method to determine surface fields within a FOV.
		when equal to one, integrate model fields over FOV. when not
		one, bilinearly interpolate model fields to FOV center.
time_window_max	3	upper limit on time window for all input data
ext_sonde	.false.	logical for extended forward model on sonde data
l_foreaft_thin	.false.	separate TDR fore/aft scan for thinning

Variable name	Default value	Description
SINGLEOB_TEST		Single observation test case setup
maginnov	1	magnitude of innovation for one observation
magoberr	1	magnitude of observational error
oneob_type	, ,	observation type (t, u, v, etc.)
oblat	0	observation latitude
oblon	0	observation longitude
obpres	1000.0	observation pressure (hPa)
obdattim	2000010100	observation date (YYYYMMDDHH)
obhourset	0	observation delta time from analysis time
pctswitch	.false.	if .true. innovation & oberr are relative (%) of background value
		(level ozone only)
obchan	0	if > 0, selects the channel number. If <= zero, it will use all
		channels that pass qc in setuprad.

Variable name	Default value	Description
SUPEROB_RADAR		Level 2 bufr file to radar wind superobs
del_azimuth	5.0	azimuth range for superob box (default 5 degrees)
del_elev	0.25	elevation angle range for superob box (default .05 degrees)
del_range	5000.0	radial range for superob box (default 5 km)
del_time	0.5	1/2 time range for superob box (default .5 hours)
elev_angle_max	5.0	max elevation angle (default of 5 deg) minnum 50 minimum
		number of samples needed to make a superob
range_max	100000.0	max radial range in meters to use in constructing superobs
		(default 100km)
l2superob_only	.false.	if true, then process level 2 data creating superobs, then quit.
		(added for easier retrospective testing, since level 2 bufr files
		are very large and hard to work with)

Variable name	Default value	Description
LAG_DATA		Lagrangian data assimilation related variables
lag_accur	1.0e-6	Accuracy used to decide whether or not a balloon is on the
		grid
infile_lag	inistate_lag.dat	File containing the initial position of the balloon
lag_stepduration	900.0	Duration of one time step for the propagation model
lag_nmax_bal	1000	Maximum number of balloons at starting time
lag_vorcore_stderr_a	2.0e3	Observation error for vorcore balloon
lag_vorcore_stderr_b	0.0	error = $b + a*timestep(in hours)$

Variable name	Default value	Description
HYBRID_ENSEMBLE		Parameters for use with hybrid ensemble option
l_hyb_ens	.false.	if true, then turn on hybrid ensemble option
uv_hyb_ens	.false.	if true, then ensemble perturbation wind variables are u,v, oth-
		erwise, ensemble perturbation wind variables are stream, pot.
		Functions.
q_hyb_ens	.false.	if true, then use specific humidity ensemble perturbations, oth-
		erwise, use relative humidity
aniso_a_en	.false.	if true, then use anisotropic localization of hybrid ensemble
		control variable a_en.
generate_ens	.true.	if true, then generate internal ensemble based on existing back-
		ground error
n_ens	0	number of ensemble members.
nlon_ens	0	number of longitudes on ensemble grid (may be different from
		analysis grid nlon)
nlat_ens	0	number of latitudes on ensemble grid (may be different from
		analysis grid nlat)
jcap_ens	0	for global spectral model, spectral truncation
pseudo_hybens	.false.	if true, turn on pseudo ensemble hybrid for HWRF
merge_two_grid_ensperts	.false.	if true, merge ensemble perturbations from two forecast do-
		mains to analysis domain (one way to deal with hybrid DA for
		HWRF moving nest)
regional_ensemble_option	0	integer, used to select type of ensemble to read in for regional
		application. Currently takes values from 1 to 4
		=1: use GEFS internally interpolated to ensemble grid.
		=2: ensembles are WRF NMM format
		=3: ensembles are ARW netcdf format.
6.11	6.1	=4: ensembles are NEMS NMMB format.
full_ensemble	.false.	if true, first ensemble perturbation on first guess istead of on
1	C 1	ens mean
betaflg	.false.	if true, use vertical weighting on beta1_inv and beta2_inv, for
C 1	0.0	regional
coef_bw	0.9	fraction of weight given to the vertical boundaries when betaflg
. a	C 1	is true
pwgtflg	.false.	if true, use vertical integration function on ensemble contribu-
	0	tion of Psfc
jcap_ens_test	0	for global spectral model, test spectral truncation (to test dual
1.4.1 *	1	resolution)
betal_inv	1	1/betal, the default weight given to static background error
		covariance if (.not. readin_beta)
		0 <= beta1_inv <= 1, tuned for optimal performance
		=1, then ensemble information turned off =0, then static background turned off the weights are applied
		per vertical level such that:
		betas_inv(:) = betal_inv , vertically varying weights given to
		static B;
		betae_inv(:) = 1 - betal_inv , vertically varying weights given
		ensemble derived covariance.
		If (readin_beta) then betas_inv and betae_inv are read from a
		file and betal_inv is not used.
	1	

Variable name Default value Description HYBRID_ENSEMBLE Parameters for use with hybrid ensemble option s_ens_h 2828 homogeneous isotropic horizontal ensemble localing (km) s_ens_v 30 vertical localization scale (grid units for now) s_ensemble and betal_inv are tunable parameters. use_gfs_ens .true. controls use of global ensemble: .t. use GFS (default)	ization scale s_h, s_ens_v,

user-defined ens	
readin_localization .false. flag to read (.true.)external localization information	
readin_beta .false. flag to read (.true.) the vertically varying beta par	rameters be-
tas_inv and betae_inv from a file.	
eqspace_ensgrid .false. if .true., then ensemble grid is equal spaced, stagge	ered 1/2 grid
unit off ploes.	
if .false., then gaussian grid assumed for ensemble (
use_localization_grid .false. if true, then use extra lower res gaussian grid for he	
calization (global runs only-allows possiblity for n	non-gaussian
ensemble grid)	
grid_ratio_ens 1 for regional runs, ratio of ensemble grid resolution	n to analysis
grid resolution	
default value = 1 (dual resolution off)	1 1 6 1, ,
oz_univ_static .false. if true, decouple ozone from other variables and	d defaults to
static B (ozone only) write ens sprd .false. writing global ensemble spread in byte addressable	1. fo fo
write_ens_sprd .false. writing global ensemble spread in byte addressable plotting with grads	ie iormai ior
	lroads:
enspreproc .false. flag to read(.true.) pre-processed ensemble data all i_en_perts_io 0 flag to read in ensemble perturbations in ensemble	
This is to speed up RAP/HRRR hybrid runs becau	
ensemble perturbations are used in 6 cycles	use the same
=0: No ensemble perturbations IO (default)	
=2: skip get_gefs_for_regional and read in ensemb	ole perturba-
tions from saved files.	F
l_ens_in_diff_time .false. if use ensembles that are available at different time	e from anal-
ysis time.	
=false: only ensembles available at analysis time of	can be used
for hybrid. (default)	
=true: ensembles available time can be different fr	rom analysis
time in hybrid analysis	
ensemble_path	

C. GSI Namelist: Name, Default Value, Explanation

Variable name	Default value	Description
rapidrefresh_cldsurf		Options for cloud analysis and surface en-
	20.0	hancement for RR application
dfi_radar_latent_heat_time_period	30.0	DFI forward integration window in minutes
metar_impact_radius	10.0	metar cloud observation impact radius in grid number
metar_impact_radius_lowCloud	4.0	impact radius for METAR cloud observation that indicate low cloud base
l_gsd_terrain_match_surfTobs	.false.	if .true., GSD terrain match for surface temperature observation
l_sfcobserror_ramp_t	.false.	namelist logical for adjusting surface tempera- ture observation error
l_sfcobserror_ramp_q	.false.	namelist logical for adjusting surface moisture observation error
l_PBL_pseudo_SurfobsT	.false.	if .true. produce pseudo-obs in PBL layer based on surface obs T
l_PBL_pseudo_SurfobsQ	.false.	if .true. produce pseudo-obs in PBL layer based on surface obs Q
l_PBL_pseudo_SurfobsUV	.false.	if .true. produce pseudo-obs in PBL layer based on surface obs UV
pblH_ration	0.75	percent of the PBL height within which to add pseudo-obs
pps_press_incr	30hPa	pressure increase for each additional pseudo-obs on top of previous level
l_gsd_limit_ocean_q	.false.	if .true. do GSD limitation of Q over ocean
l_pw_hgt_adjust	.false.	if .true. do GSD PW adjustment for model vs. obs station height
l_limit_pw_innov	.false.	if .true. do GSD limitation of PW obs
max_innov_pct	0.1	sets limit of PW ob to a percent of the back-ground value (0-1)
l_cleanSnow_WarmTs	.false.	if .true. do GSD limitation of using retrieved snow over warn area (Ts > r_cleanSnow_WarmTs_threshold)
l_conserve_thetaV	.false.	if .true. conserve thetaV during moisture adjustment in cloud analysis
r_cleanSnow_WarmTs_threshold	8.0	threshold for using retrieved snow over warn area
i_conserve_thetaV_iternum	3	iteration number for conserving thetaV during moisture adjustment
l_gsd_soilTQ_nudge	.false.	if .true. do GSD GOES cloud building
l_cld_bld	.false.	if .true. do GSD soil T and Q nudging based on the lowest t analysis increment
cld_bld_hgt	1200m	sets limit below which GOES cloud building oc-
build_cloud_frac_p	0.95	sets the threshold for building clouds from satellite
clear_cloud_frac_p	0.1	sets the threshold for clearing clouds from satellite
nesdis_npts_rad	1	NESDIS cloud product impact radiu (grid points)
iclean_hydro_withRef	1	if =1, then clean hydrometeors if the grid point has no echo and maxref=0
iclean_hydro_withRef_allcol	0	if =1, then clean whole column hydrometeors if the observed max ref =0 and satellite cloud shows clean

Variable name	Default value	Description
rapidrefresh_cldsurf		Options for cloud analysis and surface en-
		hancement for RR application
l_use_2mq4b	0	background used for calculate surface moisture
		observation innovation
		=0 Use Q from the 1st model level. (default)
		=1 use 2m Q as part of background
i_use_2mt4b	0	background used for calculate surface tempera-
		ture observation innovation
		=0 Use T from the 1st model level. (default)
		=1 use 2m T as part of background
i_gsdcldanal_type	0	options for how GSD cloud analysis should be
		conducted
		=0. no cloud analysis (default)
		=1. cloud analysis after var analysis
		=5. skip cloud analysis and NETCDF file update
i_gsdsfc_uselist	0	options for how to use surface observation use
		or rejection list
		=0 . EMC method (default)
		=1 . GSD method
i_lightpcp	0	options for how to deal with light precipitation
		=0 . don't add light precipitation (default)
		=1 . add light precipitation in warm section
i_sfct_gross	0	if use extended threshold for surface T gross
		check
		=0 use threshold from convinfo (default)
		=1 for cold surface, threshold for gross check is
		enlarged to bring more large negative innovation
		into analysis.

Variable name	Default value	Description
CHEM		Chemistry data assimilation
berror_chem	.false.	if berror file is supplied for chemistry
oneobtest_chem	.false.	single observation test for chemistry
maginnov_chem	30.0	if oneobtest_chem=T magnitude of innovation
		for chemistry
magoberr_chem	2.0	if oneobtest_chem=T magnitude of observation
		error for chemistry
oneob_type_chem	pm2_5	if oneobtest_chem=T type of chemical observa-
		tion
oblat_chem	45.0	if oneobtest_chem=T latitude of the observation
oblon_chem	270.0	if oneobtest_chem=T longitude of the observa-
		tion
obpres_chem	1000.0	if oneobtest_chem=T pressure of the observation
diag_incr	.false.	if user wishes to output to a binary file increment
elev_tolerance	500.0	for surface chemical observation sometimes ele-
		vation (elev_obs) of the measurement is available
		(sometimes not).
tunable_error	0.5	tuning parameter to specify representativeness
		error for in-situ observations
in_fname	cmaq_input.bin	name of background file for cmaq
out_fname	cmaq_output.bin	name analysis file for cmaq
incr_fname	chem_increment.bin	if diag_incr=T name of the binary dump for
		pm2_5
laeroana_gocart	.false.	when true, do chem analysis with wrfchem and
		modis
l_aoderr_table		
aod_qa_limit		
luse_deepblue		
aero_ratios		
wrf_pm2_5
